SCHEMATIC DESIGN

INTRODUCTION

At the September 30, 2009 MSBA Board Meeting, the District was authorized to proceed through Schematic Design with a 130,000 sf, 900 student, Grades 5 & 6 new construction Middle School. In its recommendation, the Board agreed with the Building Committee Preferred Solution and cited the following reasons:

- Satisfies all current code requirements and does not rely on AAB code relief
- More energy efficient facility estimated to be 20% more efficient than a renovation/addition option; based on initial estimates the cost savings could be on the order of \$2.5 million over 20 years
- Strengthens the connection to the Oak Middle School enabling increased sharing of resources between the middle schools
- Best meets the modified educational program
- Better addresses site deficiencies
- Less disruption to students and staff and a shorter construction schedule.

With the authorization to proceed, the Design Team progressed with the design documents to meet or exceed MSBA requirements for Schematic Design.

Several televised public presentations were made by the Building Committee, the OPM, and LPA with the objective of outlining the Feasibility Study and Schematic Design process and conclusions and encouraging public discussion of any related issues. At each meeting, images of the existing Sherwood School and the proposed were presented along with an outline of the MSBA process and expectations. The presentations were as follows:

- November 18, 2009 Shrewsbury School Committee Meeting
- November 23, 2009 Sherwood Building Committee Public Hearing
- November 30, 2009 Shrewsbury Board of Selectmen Meeting

On November 17, 2009, the Schematic Design drawings, outline specifications, and Room Data Sheets were distributed to the Design Team cost estimator and the OPM cost estimator and their reports are included in Section 1.15.N. of this report.

In addition to the following report, the Schematic Design submission includes an electronic file with the following documents not included in this report due to size:

- Room Data Sheets (11/17/09)
- Schematic Design Drawings dated November 17, 2009
- Outline Specifications dated December 11, 2009

Also in the electronic file is a copy of this report.

This submission is scheduled to be reviewed at the January 28, 2010 MSBA Board Meeting for authorization to proceed through construction.

1.14 FINAL DESIGN PROGRAM FOR PREFERRED SCHEMATIC DESIGN

A. Philosophy Statement

- Program Goals
- Special Education Program

Mission: *The Shrewsbury Public Schools in partnership with the community will provide students with the skills and knowledge for the 21st century, an appreciation of our democratic tradition and the desire to continue to learn throughout life.*

The Shrewsbury Public Schools recognize that the purpose of grouping is to create learning environments that best meet the needs of students. As a result, the school district supports flexible grouping practices at all levels.

In order to deal effectively with mixed ability groups and students with special needs, teachers must be classroom managers, using a variety of instructional practices. These may include pretest and post-test evaluations, small group lessons, learning stations, cooperative learning, peer tutoring, independent study, and the use of technology.

The Shrewsbury Public Schools recognize that students grow and change during their years in school and that school programs must respond accordingly. Students must not be categorized and tracked in such a way as to limit their potential growth. Consequently, each level in the system develops flexible grouping strategies based upon the ages and the needs of its students.

Middle school students are members of heterogeneous, interdisciplinary teams designed to include all achievement and ability levels. The teachers on the teams make decisions about the groups within their teams and utilize a variety of grouping strategies throughout the school year.

Recognizing the developmental needs of the young adolescent Sherwood Middle School must ensure that students are prepared to be successful, productive, and contributing members of an ever-changing global society. In this context, students will demonstrate communication skills, facility in social interaction as a team member, problem solving, decision-making and analytic capabilities, civic responsibility, personal skill in developing and maintaining wellness, and the use of technology as a tool for learning.

All students are assigned to teacher teams, typically with adjoining rooms. These teachers work together to deliver the core curriculum to each student. They have common planning time and work closely together planning instructional units, seeking coordination wherever appropriate. Several teams work together in pods. Pods are groups together and share common space and planning time in the building. This allows for teams to work together on interdisciplinary units, field trips, and special events.

Sherwood Middle School

1.14 FINAL DESIGN PROGRAM FOR PREFERRED

SCHEMATIC DESIGN

SCHEMATIC DESIGN A. Philosophy Statement

- Program Goals

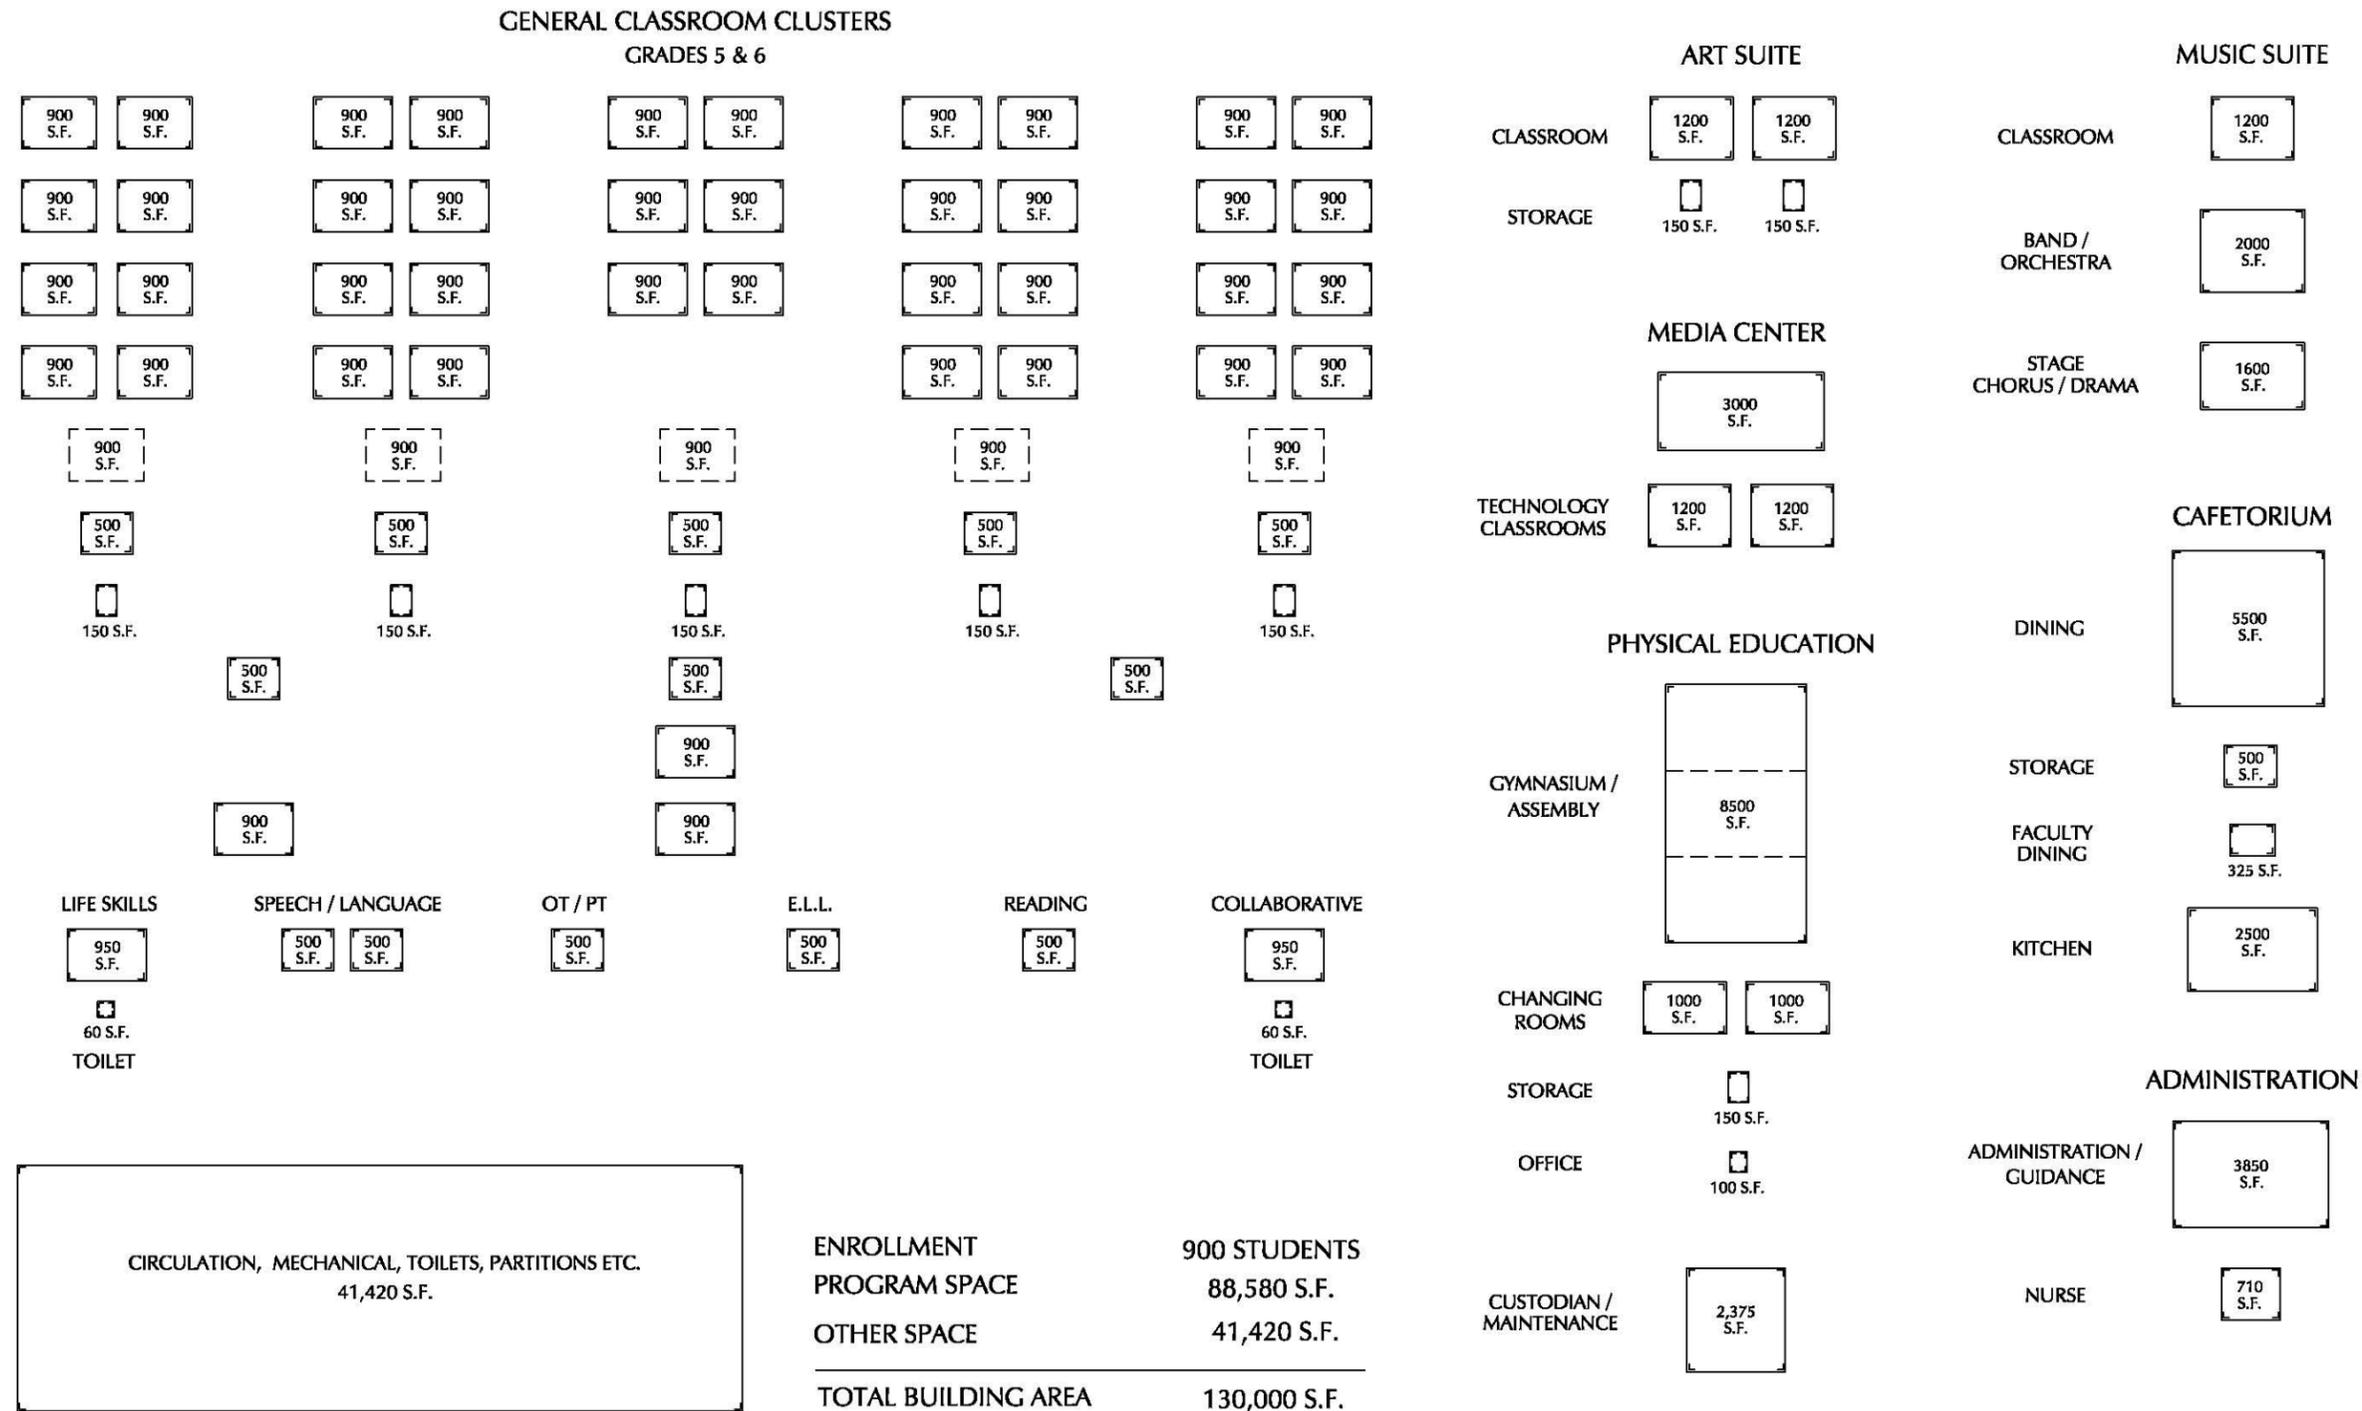

Working with the Shrewsbury School District Mission Statement, LPA collaborated with the School District representatives to develop the appropriate program for the new 900 student Grades 5 and 6 school. The following priorities were established:

- Develop a “neighborhood” concept of five clusters of 6-8 general classrooms supported by one Special Education resource room and a multipurpose “Common Room” for team projects as well as tutorials. In this manner, the 900 student school will have a more intimate, approachable design aesthetic.
- Design the classroom clusters with the possibility of adding one classroom to each in the future, should the need arise
- Integrate flexibility as much as possible by:
 - using structural systems that easily allow for future partition changes
 - appoint classrooms uniformly for schedule adaptability
 - design cafeteria, and gym to accommodate extended day and summer programs, assembly, community and school meetings as well as daily activities
- Support the team teaching concept with communicating doors between classrooms and connection to the Common Rooms
- Maximize the utilization rate for academic rooms to minimize the quantity of instructional spaces required
- Group spaces used after hours so that academic wings can be secured at the end of the school day
- Consider and reinforce the ability to share space and faculty at the Oak Middle School through site design
- Distribute special education spaces throughout the school to limit travel time for students
- Design the Media Center as an easily accessible core facility with prominence

The following spatial diagram illustrates the program goals as they were developed for the final schematic design.

40 Broad St.
Boston, MA 02109

November 10, 2009

Dear Ms. Lynch:

Please accept this letter and accompanying information as documentation regarding how the proposed new Sherwood Middle School in Shrewsbury is designed to meet the learning needs of students with disabilities. Sherwood Middle School currently houses all fifth and sixth grade students who attend school within the Shrewsbury Public Schools, and the proposed new building would include the same two grades. The Shrewsbury Public Schools strives to meet all state and federal requirements for special education, and the Department of Elementary and Secondary Education's (DESE) coordinated program review audit in the spring of 2009 confirmed that we have a very high level of compliance with regulations. However, this audit did identify a problem with speech and language instruction sharing space with a regular classroom at Sherwood Middle School.

Our goal is to go beyond compliance in order to provide every one of our students with an excellent education. Our results on the Massachusetts Comprehensive Assessment System (MCAS) tests indicate that our special needs population performs well above state averages, and we were recently cited by a Rennie Center study as a school district whose students with disabilities exceed expectations. However, as with most districts, we are struggling to meet the No Child Left Behind mandate of "adequate yearly progress" (AYP) for our special education subgroup as the performance standard moves closer to an expectation of 100% proficiency for all students. Sherwood Middle School was identified for improvement for special needs students in mathematics in 2005, improved performance enough to remove this designation in 2008, but did not achieve AYP for special education students in 2009 in both mathematics and English language arts. Failure to achieve AYP in 2010 in either subject for special education subgroups will return the school to improvement status with the DESE.

The Sherwood Middle School's special education population, as of the October 1, 2009 enrollment report, is 142 out of 909 students, or 15.6%. This is a consistent percentage compared to the rest of the district (16.6%) and the state (17.1%).

Shrewsbury Public Schools is committed to providing comprehensive programs for students with disabilities. The school system subscribes to the philosophy that all students can learn and that the

purpose of special education is to minimize the impact of disability and maximize the students' ability to achieve success in the least restrictive environment with the greatest access to the general curriculum.

In order to achieve these goals, the district supports a variety of special education programs consistent with the philosophy of educating children in the least restrictive environment.

Current Program: Programs that support students at Sherwood Middle School currently include:

➤ **Full inclusion:** Students with disabilities who can access the curriculum with modifications and accommodations supported by a special educator who works directly in the classroom with the regular educator. The classroom, a student, or a group of students may also have a paraprofessional in the classroom to support student success. Examples of students who benefit from this program include students with Asperger's Syndrome, specific learning disabilities, intellectual delays, Attention Deficit Hyperactivity Disorder, and/or communication disorders.

It is important to note that in 2007, the administration of Sherwood Middle School, in consultation with the special education department, made the decision to convert funding for six special education paraprofessional positions in order to provide two special education teachers. This choice permitted one special education teacher to be assigned to every two regular education teams (teams are two teachers who each teach two core subjects: English language arts and social studies or mathematics and science). These teachers spend more time in the regular education classrooms than in the past, meet regularly with the regular education teachers, and even have their desks placed in one of their team classrooms.

➤ **Co-Teaching:** Co-teaching is an instructional delivery approach in which general and special educators share responsibility for planning, delivery and evaluation of instructional techniques for a group of students. General and special educators work in a coactive and coordinated fashion, which involves the joint teaching of academically and behaviorally heterogeneous groups of students in integrated settings. The teacher to student ratio is decreased thus providing support to all students in the classroom. This program was primarily designed for students with language Based Learning Disabilities who may have required an out of district placement that specialized in language based instructional practices. However, other students with learning disabilities also benefit from this program.

➤ **Essential Skills:** Students who require specially designed instruction in the areas of Math and English Language Arts have an opportunity to learn at their own pace and instructional level with a special educator. These students receive their instruction at the same time as their peers, but in a different classroom. The same content is taught, but the instruction for each student is modified to ensure the successful acquisition of the content. The special educator meets weekly with the regular educator to coordinate the lesson plans and content being taught. The special educator also consults to the classroom teachers regarding the differentiation of instruction in the other content areas as well as modifies the curriculum for students who are included during that instructional period.

➤ **Life Skills:** Students with severe disabilities (such as those on the autism spectrum, with Down Syndrome, etc.) who may require significant modifications to their instruction, behavior support, and who may require instruction in the areas of independent living skills, daily living skills, and vocational skills in order to make effective progress in their educational program receive coordination and instruction in a

separate classroom(s) by a special educator. This is a unique program in that there are opportunities across the day for many of these students to participate with their typical peers in a class or classes as well as all allied arts classes. These students typically have 1:1 or 1:2 supports by a paraprofessional to ensure access to programming throughout their day.

➤ **Ancillary Services:** As is likely the case in every public school district, Sherwood Middle School provides students with ancillary special education services, including speech and language therapy, occupational therapy, physical therapy, adaptive physical education, psychological services, etc.

Shrewsbury continues to seek creative ways to educate students in the least restrictive environment. This requires strategic planning regarding the use of space and the ability to plan for the increase in the number of students that require specialized programs in order to meet their educational goals.

Of the five elementary schools in Shrewsbury, three have programs that support students on the autism spectrum with intensive special needs. These students will all require continued support academically and behaviorally. The space identified in the new building project will provide the classrooms needed for these students to succeed while minimizing the need to seek out of district placements.

In addition, the position of district-wide clinical coordinator provides access to the curriculum for students with behavioral challenges. This role, staffed by a master's level behavior analyst, supports students in regular education and special education requiring clinical services and support. The clinical coordinator's primary responsibility in regular education is to assist the classroom teacher identify students who may be engaging in challenging behaviors that interfere with learning, conduct a functional behavior assessment, develop positive behavior support plans, train staff to implement the plans, and follow-up when needed. The primary responsibility in special education is to develop procedural consistencies, develop accountability and reliability procedures, supervise home support programs, consult to district wide programs, and provide professional development. The addition of this position further supports Shrewsbury's ability to educate children with more intensive special needs at the middle school level.

Proposed Program:

The district administration and building administration worked with the architects regarding the current and future needs of the special education program. While a similar approach to the one described above will be used, a movement towards a more inclusive program is intended, both because of trends in best practice and because the new building will have larger general classrooms and more suitable specialized instructional spaces that provide the opportunity for special education support that aligns with inclusionary practices.

There are no plans to move other special education programming from other locations in the district to the new building.

The MSBA's October 5 space summary evaluation letter noted that the proposed new building has 2,540sf less space allocated to special education than the MSBA space guidelines provide. It is our belief in Shrewsbury that the proposed design of the new Sherwood Middle School provides the appropriate instructional and support spaces for the special education program, while providing flexibility as this program changes over time to respond to the needs of students and updates regarding best practices in the

field. In addition to designated separate spaces, we believe that the design of the common spaces in each classroom wing provides additional flexibility for small group instruction, emphasizing inclusion and co-teaching models. A description of the proposed spaces follows:

- Self-contained, full size special education classrooms (2 @ 950sf): One of these classes will be designed to accommodate the life skills program, and will include a bathroom and be located next to the nurses office, which is intentional due to the medically complex nature of some of these students (autism spectrum, neurological, intellectual disabilities, etc.). The other is designed to flexibly accommodate a student population that is not appropriate for a more inclusive program (e.g., autism spectrum, behavioral needs, significant learning disabilities such as dyslexia, etc.)
- Resource rooms (5 @ 500sf): These classes are designed to provide an alternative learning space for students who spend most time in the regular classroom but require small group instruction for pre-teaching, reinforcement, and other support. Each of the five classroom wings has one of these rooms.
- Small group/reading rooms (4 @ 500sf): These rooms are labeled “reading” to match the MSBA template language. These four rooms would be used for the following functions: Two for speech and language services, one for continuation of the school program’s reading intervention program (regular education/response to intervention program), and one for providing services to English language learners.
- Occupational therapy/physical therapy room (1 @ 500sf): This room will be used for occupational and physical therapy service delivery.
- Adaptive physical education space (portion of gymnasium @ 2,833sf): The building proposal includes a gymnasium divided into three teaching stations; one of these stations is intended to be used as needed for adaptive physical education programming.
- Common space within classroom wings: The building design includes common space in each of the five classroom wings (colored gray on the floor plan). This space is intended to be used flexibly throughout the day and to include opportunities for the instruction of small groups of students, including but not limited to special education students who will be included in the regular education classrooms surrounding the space.

Thank you for reviewing this information, and please do not hesitate to contact me if I can answer questions or be of any further assistance.

Respectfully,

Joseph M. Sawyer, Ed.D.

SCHEMATIC DESIGN

Introduction

B. Room Data Sheets

The following Room Data Sheets are intended to outline programmatic details for each major space including intended uses, adjacency requirements, standard and specialized features to meet the school's objectives. The program data included is the result of multiple meetings with District staff and faculty, Shrewsbury town officials and department heads, and consultants to determine the most appropriate elements for the Grades 5 and 6 educational program needs.

Many features are shown in this document to supplement the drawings and outline specifications where more detail is warranted. In particular, the millwork, visual display boards, and telecommunications requirements are delineated.

The following key further describes the millwork components shown within this document:

* All sink units and millwork to comply with accessibility guidelines.

M1	48"w x 84"h lockable teacher wardrobe with clothes pole and 5 shelves for storage
M2	48"w x 84"h supply cabinet with lockable doors, center divider and 5 adjustable shelves
M3	36"h base cabinet with drawers and doors and plastic laminate counter top and backsplash 30"h wall cabinet with doors See individual Room Data Sheets for length
M4	32" high open shelving unit with plastic laminate counter/backsplash, pencil grille at base and top 24" d light shelf at bottom elevation of topmost window full length of windows See individual Room Data Sheets for length
M5	Plastic laminate adjustable shelving on heavy duty brackets and standards with vertical every 36", 4" high base, and plastic laminate cap
M6	36"h base cabinet with doors and drawers and plastic laminate counter top and backsplash 30" high wall open shelving units
M7	30"d x 48" w x 84" high open paper shelving unit with (8) adjustable shelves
M8	Plastic laminate shelf unit with 1-1/2"d. coat rod and brackets
M9	30" high base unit with doors and plastic laminate counter with 12"d x 5"w x 12" h mailbox open cubby units with label holders
M10	Custom 30"h desk unit with 12" h deal shelf above. All counters solid surface with grommets for wire management. Drawer/door and file base units.
M11	36" h base cabinet with doors and drawers, epoxy counter and backsplash
M12	36" h ADA compliant base cabinets and plastic laminate counter and backsplash 30" h wall cabinets with doors

7. Life Skills

GENERAL CRITERIA

Description: Special Education space to teach basic life skills. Some students are in the classroom full day, others part of the day.

Area: 992sf

Quantity: 1

Users: Students/teachers/aides

Occupant Load: Varies – typically 6 – 12 students

Adjacencies: General classroom for flexibility if program requires expansion, exterior access for emergency purposes, toilet facilities within the suite.

FIXTURES/FURNITURE/EQUIPMENT

Millwork (In GC contract):

- M1 – Teacher Wardrobe
- M2 – Storage unit
- M4 – 20lf under window shelving cabinet
- M12 – 19lf base and wall kitchen cabinets
- M2 – 48”w cleaning supply cabinet

Furniture (Not in GC contract):

- (1) Teacher desk and chair
- (6) computer stations and chairs
- (1) 48” round table and (4) chairs
- (2) trapezoidal tables and (6) chairs
- (6) tablet chairs with retractable tablets
- (3) 6’wx6’h portable acoustic partitions

Equipment (In GC contract):

- V1 – Smartboard unit
- V2 – (1) 8’ markerboard
- V3 – (1) 4’ markerboard
- (8) double height 15” wide lockers

Equipment (Not in GC Contract):

- Washing machine/Dryer
- Full height refrigerator
- Range/oven
- Dishwasher
- Microwave oven

TECHNICAL CRITERIA

OTHER INFORMATION

Architectural:

Window shades

Plumbing: Kitchen sinks, dishwasher, washing machine

Mechanical: Provide dryer venting

Electrical: Provide 220v power for dryer, range, etc.

Lighting:

- (4) 16' Direct/indirect dual switched fluorescent fixtures with (1) occupancy and (1) day light sensors.
- (1) 6" Round LED emergency down light fixture.

Electrical:

- (1) Duplex receptacles for smart boards.
- (2) GFCI duplex receptacles for counter top.
- (5) Quad receptacles for computer stations.
- (1) duplex outlet for each: refrigerator, microwave oven, dishwasher, washer
- (1) 220V outlet for each: dryer, range/oven

Low Voltage:

- (1) Audio/visual fire alarm device with a candela rating of 110cd.
- (1) Classroom panel clock/speaker combination unit.

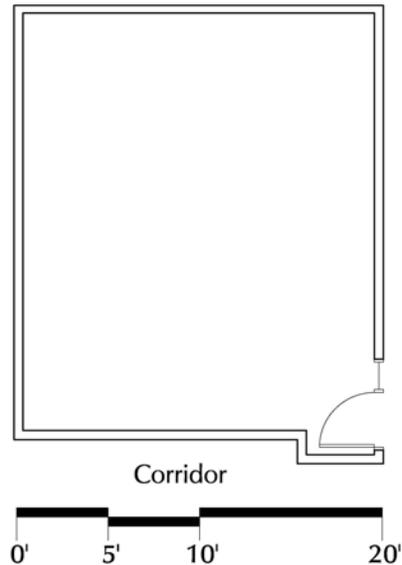

Communications:

- (2) Voice outlets for telephones.
- (6) Data outlets for computer stations.
- (1) Data outlets for smart board/access points.

- (1) Duplex outlet for the projector.
- (4) Flush floor outlets @ cashier stations.
- (1) Projector.
- (1) Power connection for the projection screen with up/dn switch.

Low Voltage:

- (4) Audio/visual fire alarm devices with a candela rating of 110cd.
- (4) Paging speakers with volume control.
- (1) Wall clock.

Communications:

- (2) WIFI access point outlets.
- (2) AV outlets for projector.
- (1) Data outlet for projector.

Intrusion System:

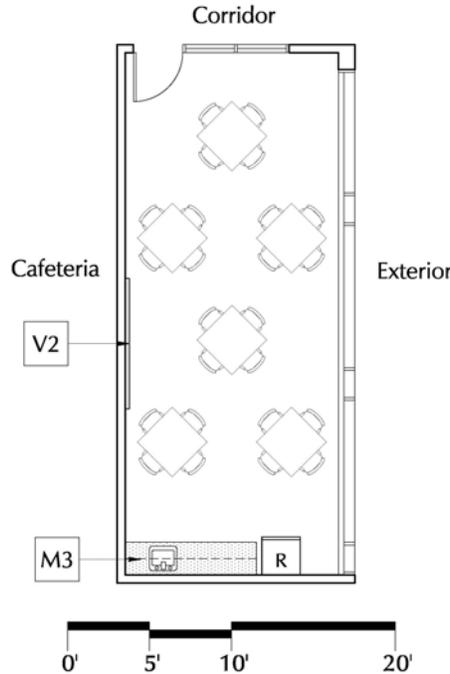

- (4) Break glass sensors.

OTHER INFORMATION

Acoustical separation between gym and cafeteria desirable

SCHEMATIC DESIGN
22. Faculty Dining

GENERAL CRITERIA

Description: Multipurpose Room used for Faculty Dining at lunch time, meetings and assembly staging area at other times.

Area: 416 sf

Quantity: 1

Users: Primarily faculty/staff

Occupant Load: 26 at tables and chairs

Adjacencies: Cafeteria

FIXTURES/FURNITURE/EQUIPMENT

Millwork (In GC contract):

M3 – 8lf base and wall cabinet unit

Furniture (Not in GC contract):

(6) 36"x36" tables and (24) chairs for flexible arrangements

Equipment (In GC contract):

V2 – (1) 8' markerboard

Equipment (Not in GC Contract):

Full height refrigerator

Microwave oven

OTHER INFORMATION

Window shades at exterior, vertical blinds at door sidelights

TECHNICAL CRITERIA

Architectural:

Plumbing: Sink

Mechanical: Pedestal radiation at windows

Electrical:

Lighting:

- (2) 12' Direct/indirect single switched fluorescent fixture with (1) occupancy sensor.
- (5) 6" Round LED dimmable switched down light fixtures.
- (1) 6" Round LED emergency down light fixture.

Electrical:

- (3) Duplex receptacles for general use.
- (1) Quad receptacle for computer station.
- (1) Duplex receptacle for each: refrigerator, microwave oven

Low Voltage:

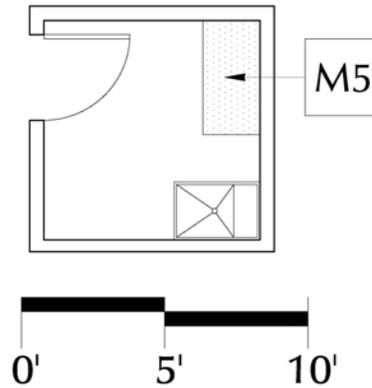

- (2) Visual fire alarm device with a candela rating of 75cd.
- (1) Paging speaker with volume control.
- (1) Wall clock.

Communications:

- (1) Voice outlets for telephones.
- (2) Data outlets for computer station/access points.

Intrusion System:

- (2) Break glass sensors.

GENERAL CRITERIA

Description: Maintenance supply closet and floor sink

Area: 50sf

Quantity: 4

Users: Janitorial staff

Occupant Load:

Adjacencies: Centrally located for easy access on each floor; kitchen suite

FIXTURES/FURNITURE/EQUIPMENT

Millwork (In GC contract):

M5 – 4lf 24”d. adj. Shelving unit with 5 shelves

Furniture (Not in GC contract):

Equipment (In GC contract):

Equipment (Not in GC Contract):

Mop rack

TECHNICAL CRITERIA

Architectural:

Plumbing: Floor sink

Mechanical:

Electrical: Lighting:

- (1) 2’x4’ Motion switched florescent fixtures.

Electrical:

- (2) Duplex receptacles for general use.

Low Voltage:

- (1) Paging speaker with volume control.

1.14 FINAL DESIGN PROGRAM FOR PREFERRED SCHEMATIC DESIGN

- D. Instructional Technology
Security and Visual Access
Requirements

Sherwood Middle School

Sherwood Avenue, Shrewsbury, MA 01545

1.14 FINAL DESIGN PROGRAM FOR PREFERRED SCHEMATIC DESIGN

SCHEMATIC DESIGN

D. Instructional Technology Security and Visual Access Requirements

TECHNOLOGY MISSION STATEMENT

Shrewsbury Public School is committed to the use of technology to create optimal learning opportunities for all students and staff. We strive to continuously improve our electronic infrastructure, which supports the use of appropriate technology for curriculum, management, communications, and professional development. Shrewsbury Public Schools, through the effective and appropriate integration of technology, strives to:

- 1) provide appropriate and sufficient technology for all teachers and students
- 2) create a seamless electronic infrastructure connecting schools, the community and the world
- 3) provide opportunities for students to use technology in meaningful ways, both in the classroom and in preparation for careers
- 4) develop learning outcomes for students and competencies for staff
- 5) provide high quality professional development for teachers, establish partnerships with town departments and businesses
- 6) maintain a broad-based technology task force.

SHREWSBURY'S HISTORY

Shrewsbury's schools, as well as the community, have been leaders in the area of developing technology options. From the establishment of Shrewsbury's Cable Co. and a strong Instructional Technology and Media Department for the schools, to the implementation of technology in the classroom and the professional development of teachers, Shrewsbury has been a model for others to follow.

SHREWSBURY'S PLAN

Shrewsbury's Plan, Setting a Vision for the Future, was developed through a partnership between school department staff, business leaders and community members. The plan includes assessment for the present state of our technology, guidelines for future growth, expectations for professionals and students as well as a plan to fund future needs.

See the Electrical specifications, Room Data Sheets, and Electrical drawings for more details regarding IT, security, and audio visual systems planned for the new 900 student school. Among some of the progressive features included are:

- Smartboards with integrated projectors and speakers are planned for all instructional spaces
- Wireless communications throughout
- Wireless intrusion detection at perimeter openings
- Climate controlled District server room
- Laptop carts with recharging stations for instructional areas

1.14 FINAL DESIGN PROGRAM FOR PREFERRED SCHEMATIC DESIGN

Requirements

Sherwood Middle School

Sherwood Avenue, Shrewsbury, MA 01545

1.14 FINAL DESIGN PROGRAM FOR PREFERRED

SCHEMATIC DESIGN

SCHEMATIC DESIGN

E. Site Development Requirements

VEHICULAR ISSUES

Bus traffic: Careful consideration must be made for separate bus and parent pick up traffic circulation patterns

- 33- 35 buses service both Oak and Sherwood at the same time
- 75 – 100 parent pick up cars at each school max.
- Crescent St. access road to be sized for bike lane, 2 lanes of traffic to allow for queuing space during pick-up/drop off time periods and auxiliary parking for heavy community use events. Traffic signage and pedestrian crosswalk required at Crescent St. intersection, but not signals.

Parking:

- 140 - 150 staff parking spaces at Sherwood
- 135 - 150 staff parking spaces at Oak
- 10 – 15 visitor parking spaces at each school
- 60 additional spaces for community use events (Note that Oak Auditorium events require max. site parking)

Service:

- Loading dock required for Sherwood
- Dumpster pad and space for pick up
- Emergency generator pad with access for refueling
- Transformer pad with access for service
- Deliveries typically box trucks, but sometimes semi-trailer; regular deliveries to kitchen, sporadic deliveries for office, mechanical, instructional equipment and supplies
- Ability to drive into Mechanical Room for servicing boilers critical

Pedestrians:

- Walkways between Sherwood and Oak to facilitate faculty/student use for shared facilities and parent pick-up/drop off at each school
- Accessible walkways to athletic fields for gym and community use
- Consideration of safe pedestrian travel during construction

Fire Access:

- Min. 20' wide paved road full perimeter access (does not need to be contiguous) for fire trucks

Sherwood Middle School

Sherwood Avenue, Shrewsbury, MA 01545

1.14 FINAL DESIGN PROGRAM FOR PREFERRED

SCHEMATIC DESIGN

SCHEMATIC DESIGN

E. Site Development Requirements

ATHLETIC FIELDS

The following existing fields have been recently upgraded with irrigation, drainage, surfaces, etc. and are heavily scheduled for school and community use and will be maintained for use during construction:

- Football field
- Running track

- Softball: The existing softball field will be reconfigured to a baseball/lacrosse field with irrigation, fencing etc. similar to the existing baseball field.

- Baseball: The existing baseball/lacrosse field will be used as a staging area for the construction and reconfigured to a softball/lacrosse field at the end of the construction period.

- Irrigation: The existing irrigation system will have expanded controls to include the new baseball/lacrosse field and the existing well will continue to be the source of water.

Recess area features:

- Located with access from the cafeteria
- Paved area that can be plowed in the winter
- (2) half court basketball units
- (300) students each recess for a 10 minute exercise period

Physical Education features:

- Typically Oak and Sherwood have designated fields for Physical Education. Easy access is important to keep class periods effective.
- Storage for outdoor equipment (4'x8' space) required
- For emergency purposes, speakers directed toward athletic fields important
- Adventure challenge course desirable
- Exterior drinking fountain

Sherwood Middle School

Sherwood Avenue, Shrewsbury, MA 01545

1.14 FINAL DESIGN PROGRAM FOR PREFERRED

SCHEMATIC DESIGN

SCHEMATIC DESIGN

E. Site Development Requirements

UTILITIES

- Existing overhead wires to Sherwood to be relocated to underground location
- New Electric service to come overhead from Sherwood Avenue and underground at site property line to west end of new building
- Water service is adequate for anticipated fire protection and plumbing needs
- Exterior grease trap required at Sherwood
- Gas service upgrade is probably required to service kitchen and HVAC needs(to be confirmed)
- Town water and sewer
- Sanitary to be gravity fed to Crescent St. connection
- Fire hydrants to be located at the front and back of the new building
- Town electric/cable TV/telephone (SELCO)
- Site lighting at parking and pedestrian walks near school only, not at athletic fields
- Dark Sky exterior lighting

CURRICULUM

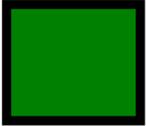

The Sherwood wooded area is used for some science curriculum

MATERIALS

- Bituminous concrete paving: DPW recommends 18" gravel base, 2-1/2" base coat, and 1-1/2" topcoat paving system
- Cape Cod berm except granite at building sidewalk edge
- Concrete pavement walks
- Concrete utility/dumpster pads
- Landscaping to be trees and lawn only – no shrubs
- Under drainage system for new athletic fields similar to existing
- Replicate wetlands as required to accommodate Crescent St. access
- Metal guards, handrails, bollards, etc

1.14 FINAL DESIGN PROGRAM FOR PREFERRED SCHEMATIC DESIGN

F. Sustainable Design Objectives

The Green Engineer, LLP

Sustainable Design Consulting

Meeting Notes

Project: Sherwood Middle School, Shrewsbury, MA

Date: October 14, 2009

Location: LPA Offices

Re: Schematic Design Meeting and Sustainability Overview

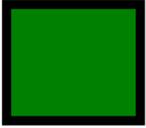

Attendees: Chris Schaffner - TGE – chris@greenengineer.com
*Marie Nolan – TGE – marie@greenengineer.com
Michael Pagano – LPA – mpagano@lamoureuxpagano.com
Katie Crockett – LPA – kcrockett@lamoureuxpagano.com
Anup Khatra – AKAL Engineering – khatra@akalengineering.com
Jeremy Moran - Seaman Engineering - jerimy@seamanengineers.com
Kevin Seaman - Seaman Engineering - kevin@seamanengineers.com
Azim Rawji – ART Engineering – azim@artec.us.com
William Maher - Nitsch Engineering - wmaher@nitscheng.com

PROJECT INFORMATION:

- Katie Crockett provided an update of the Sherwood Middle School (SMS) project.
- Town authorized LPA to complete Schematic Design for a new 130,000 gsf building. The complete package is due 12-30-09. Outline specs and cost estimates are due early December. Building is west of existing school and east of Oak Middle School. Existing ball field is on site that will be relocated south of the building (softball and baseball fields are being built).
- Three levels: basement, first and second floors; classroom clusters on each floor. Air conditioning will be in administrative areas, media center, tech labs and any other interior occupied spaces as required. Lobby is two-story open glazing facing south and closed at third level.
- Exterior will be insulated metal sheathing with some brick; Centria system up to 3" continuous insulation.
- Reduced number of classrooms, classroom size to 900 sf/classroom, and cafeteria size.
- Significantly less exterior wall and roof in new building compared to Oak School.
- No discussion by town of school acting as an emergency shelter.
- Gym, cafeteria and couple of classrooms will be used during the summer.
- 900 students, 135 staff? 300 seats in cafeteria, 3 lunches
- Town wants to take advantage of the 2% financing provided by the State for being a MA CHPS school.

DELIVERABLES FOR MA-CHPS:

- Current design, Scorecard, back-up narrative, statement from school saying affirming decision to go for MA-CHPS and earn at least 34 points.
- Question: Does MSBA or MA CHPS have LCCA requirement for this stage?

Potential Mechanical Systems:

- Current thinking is hydronic heating with heat recovery units, low temperature condensing boiler, ventilation system and possible package AC unit on roof.
- Supplemental geothermal heating-only unit may be assessed. Would make more sense if used for heating and cooling. Negative aspect - having to maintain 2 pump systems.
- Solar wall on gym for heating makeup air and ventilation planned. Centria System.
- Goal when choosing mechanical system: Pick what works with limited budget and desire for limited maintenance.
- Bob Cox, Shrewsbury Facilities Director wants low cost, easy maintenance solutions.
- Solar on roof is separate decision. Could have "solar ready" building. Power Purchase Agreements exist for placing solar on existing schools; can take advantage of federal tax credits.

Energy Use:

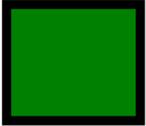

- Buildings over 40% glazed are not energy efficient.
- Energy efficiency is driven by building envelope/insulation and lighting. Need to target LPD; code is 1.0 watts/sf so may want to specify 0.7 wsf.
- Need to coordinate AC with lighting
- Specify Energy Star efficient equipment, premium motors
- Having little AC will not get the project more energy points as design case will be compared to non-AC base case.
- Variable speed exhaust for hood in cafeteria with makeup air.
- Remote condensing for walk-in refrigerator.
- No shop, no pool - so unlikely will have use for solar thermal system. Solar thermal has a long payback and requires more maintenance compared to PV.

Water Use:

- Project can easily achieve 30% reduction; adult sized fixtures
- Waterless urinals - Good to have this discussion with client. Get fumes if not maintained properly. Best to have waterline hookup ready in case there are problems.
- TGE recommends low flow urinal - 0.8 gallon flush
- Water closet can be dual flush or low flush
- Design sinks in all classrooms and a couple of showers in building
- Aerators for hand washing and automatic sensors (timing or motion), could be innovation credit if high % savings
- On town sewer, with no water treatment or storage preferred by maintenance staff.
- Continue irrigation of ball fields? Specify appropriate soils and drought tolerant grasses for new ball fields
- No permanent irrigation after establishing drought-resistant plants on non playing fields to achieve WC2.1.
- Consider rain barrels for water collection
- LPA will be doing landscape design through SD

Site Characteristics / Land Use:

- School will be built on existing school land
- Determine if crossing a wetland; federal requirements are 2:1 ratio if filling in a wetland
- If building new driveway, add bike lane

- Parking will be increased over minimum local zoning requirements as is case now for the existing school
- CHPS stormwater requirement is stricter than MA DEP and LEED, so “no” for SC3 credit.
- Need 30% of non roof surfaces to have shade or light-colored materials for SC4.1 credit, shade is calculated using a 5-year tree canopy.
- White roofs are generally better than dark colored in the U.S., heat gain of building is minimal but heat island impact is important. Cool roof is better for package equipment.
- Exterior light pollution reduction issues- Are lights on timers? Are there lights at the ball fields? School is in neighborhood and may have a covenant with residents.

Materials:

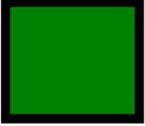

- Need adequate central storage for recyclables. How will recyclables be collected? Need bins in classrooms and cafeterias.
- If the building chooses a product that minimizes waste, there is not a credit for it but an innovation credit could be submitted.
- The demolition of the existing building is key to MC1 compliance. Figure out how the demolition fits into the project schedule and track the C&D waste.
- Local asphalt, paving and landscaping is included in MC3.
- MA CHPS wants as many MA products specified as possible.
- MC3 involves a complicated calculation; next CHPS version will go back to LEED approach.
- Subs give information on steel, concrete, gypsum, metal studs, etc. to contractor.

Indoor Air Quality:

- Sherwood uses a service for cleaning buildings. Janitor storage areas need their own exhaust.
- IEQP 9 - No gas pilot lights including kitchen equipment; limit use of duct liners and use good quality.
- IEQP 14 - MA CHPS recognizes that complying with AHRAE thermal comfort standards can be tricky with no AC.
- IEQ1.1 - Views are to include administrative areas but not meeting rooms.
- No returns will be out of classrooms, plenum returns?
- IEQ2.3 - Check with Maintenance about MERV 13 filters, higher efficiency but costs more.
- Can specify vacuuming carpeted area prior to completion - IEQ2.4
- IEQ3 - acoustical performance in classrooms - no ventilators so maybe max 30 NC
- Can provide for temperature/light control for a certain range
- Alternate cost estimate could be for using LED lighting.
- Daylight dimming in schools is an option; required to have double switching by code.
- Lights in parking lots - what is required by Shrewsbury code?

Summary of Key Issues:

1. Landscape design as it relates to parking lot and shade
2. Water use - reductions to propose to owner
3. Landscape design as it relates to irrigation
4. Lighting design
5. Mechanical system design
6. Demolition of existing school

7. Daylighting analysis of classrooms
8. Acoustical requirements

Innovation Credits - only get 3:

- Higher percentage water reduction
- Selection of materials to reduce waste
- Low mercury lighting
- Combining education with green building - solar wall, efficient envelope, computer in lobby
- Solar LED site lighting
- Dishwashing in cafeteria

Solar PV as part of construction:

- Purchase Power Agreement is a possibility; MTC funding is not possible.
- Could invite proposals for a PPA using federal tax credits
- TGE will put together a brief narrative of our discussion about alternative energy sources and the reasons they were discounted for this project.

NEXT STEPS:

- Update MA CHPS Scorecard
- Assign responsibility of credits to team members

ATTACHMENTS:

- REVISED MA-CHPS Checklist for the Sherwood Middle School.
- Currently at a total project score of 40

The forgoing discussions of this meeting are recorded as understood by the writer (marked by *), who should be notified of any omissions or corrections. Unless the writer is notified to the contrary, this report is presumed correct.

MINUTES OF SCHOOL COMMITTEE MEETING

WEDNESDAY, NOVEMBER 18, 2009

Present: Ms. Erin Canzano, Chairperson; Mr. John Samia, Vice Chairperson; Ms. Sandra Fryc, Secretary; Mr. Steve Levine; Mr. Mark Murray; Dr. Joseph Sawyer, Superintendent of Schools; Dr. Jay Cummings, Assistant Superintendent; Ms. Anne Mahan, Director of Business Services; and Mr. Thomas Kennedy, Director of Human Resources.

The meeting was convened at 7:04 PM.

I. Public Participation: None

II. Chairperson's Report/Members' Report:

Mr. Samia advised that the School Committee; the Board of Selectman; Mr. Daniel Morgado, Town Manager and Dr. Joseph Sawyer met on November 12, 2009 to discuss the current status of the FY10 budget process, as well as the upcoming FY11 budget and beyond. Topics of discussion included stimulus money, long term fiscal planning and charter school funding. The taped meeting will air on Channel 30.

Mr. Samia announced that the November edition of "School Talk" was recently taped and the topic of discussion was the school budget. This program will also air on Channel 30.

Mr. Levine reported that the Transportation Task Force met today and may be ready to bring forward their final recommendations to the School Committee in December, 2009.

Ms. Canzano announced that the town is looking for poll workers for the 2010 elections. Interested candidates should contact the Town Clerk's office. Mrs. Canzano stated that there would be a public hearing on the Sherwood Middle School Building project on November 23, 2009 at the Town Hall. On November 30, 2009 the School Committee will make a presentation regarding the Sherwood building project to the Selectman. December 8th the Sherwood Building Committee will vote on the schematic design plan.

III. Superintendent's Report:

Dr. Sawyer thanked the Rotary Club for their participation and generosity surrounding the annual reading day that took place in all second grade classrooms throughout the district. Rotary members read a book to the class, which was followed by a discussion about community service. Each second grader was given a book donated by the Rotary Club.

Dr. Sawyer announced that on November 17, 2009 the Alumni Association awarded (19) grants, (17) of which went to special academic projects submitted by high school students and their faculty advisors. He thanked members of the Alumni Association Executive Board and the Grant Selection Committee.

Dr. Sawyer recognized many high school athletic teams for the recent accomplishments. The Girls' Volleyball team and the Girls' Soccer teams qualified for district playoffs. The Field Hockey team won the District Championship but lost in the State Semi-Finals. Both the Boys and Girls' Cross Country teams finished third in the Districts and qualified for state competition.

Dr. Sawyer said he was very pleased and proud of the community spirit and support shown by faculty, students and administrators in our schools to families in need. Dr. Sawyer advised the committee about a recent matter concerning a family who had fallen on hard times. When the faculty at the student's particular school learned of the family's current problems, they helped them locate the necessary services to assist the family. Dr. Sawyer pointed out that our schools do more than provide education to our students, but also display a high level of compassion, care and service to others in need.

IV. Time Scheduled Appointments:

A. Spring Street School Student Presentation

The School Committee welcomed Spring Street School students, Sam Brownstein, Anthony Shea, and Christopher Stephenson whose essays were chosen as winners in Representative Karyn Polito's "Defining the American Dream" essay contest. Mrs. Barbara Luby, Grade 4 teacher at Spring Street School and Mr. Bryan Mabie, Principal of Spring Street School, gave a brief overview of the contest as well as the connection with the student's social studies work and the Rigby reading program. Each student read their essay and was presented a certificate by members of the School Committee.

B. Sherwood Middle School Building Project: Presentation and Vote

Mr. Henry Fitzgerald, Chair of the Sherwood Middle School Building Committee recapped the past six months of the Sherwood School Building process since it was brought forward again in May 2009. Mrs. Jane Lizotte, Principal at Sherwood Middle School provided the committee with an "existing-conditions" overview. Ms. Katie Crockett, Architect, Lamoureux Pagano Associates, addressed health and safety issues as well as the financial costs associated in renovating the building verses building a new school. Mr. Michael Pagano, Architect, Lamoureux Pagano Associates presented the schematic design for the proposed new Sherwood Middle School building and the possibility of new traffic patterns and circulation routes. As required for a building project to be approved by the MSBA, the School Committee then had to formally vote to approve the proposed program that would be supported by the project. On a motion from Mr. Samia, seconded by Ms. Fryc, the School Committee voted unanimously to "approve the Design and Educational Program and the Budget Statement for Educational Objectives for the Sherwood Middle School Building Project."

C. Shrewsbury High School Class of 2009 Future Plans Report

Dr. Jay Cummings introduced Mr. Greg Nevader, Director of Guidance at Shrewsbury High School who provided data regarding post-high school plans for the Class of 2009.

D. Update on Special Education Programs

Ms. Melissa Maguire, Director of Special Education and Pupil Personnel Services, presented an update on special education programming. Dr. Sawyer advised that the report will be posted on the district website as it contains useful information regarding the special education program.

V. Curriculum – None

VI. Policy – None

VII. Budget – None

VIII. Old Business – None

IX. New Business – None

X. Approval of Minutes

On a motion from Mr. Samia, seconded by Mr. Levine, the School Committee voted five to zero to approve the minutes from the November 4, 2009 meeting.

XI. Executive Session - None

XII. Information Enclosures - None

XIII. Adjournment

On a motion from Mr. Samia, seconded by Mr. Murray, the meeting was adjourned at 9:16 PM.

On a roll call vote: Mr. Murray, yes; Mr. Levine, yes; Ms. Fryc, yes; Mr. Samia, yes; Ms. Canzano, yes.

Respectfully submitted
Kathleen Granados, Clerk

**TRAFFIC IMPACT AND ACCESS STUDY
SHERWOOD MIDDLE SCHOOL
SHREWSBURY, MASSACHUSETTS
Nitsch Project #7683
October 28, 2009**

INTRODUCTION

General/Site Location

Nitsch Engineering has been retained by Lamoureux Pagano Associates to prepare a qualitative assessment of safety, traffic circulation, traffic access/egress, and parking impacts, for the proposed construction of a new Sherwood Middle School in Shrewsbury, Massachusetts. The project consists of approximately 130,000 square feet middle school buildings.

The existing Sherwood Middle School abuts the Oak Middle School and both share athletic fields and parking. The area surrounding the middle schools generally consists of residential neighborhoods. The major access roads within the study area are: Oak Street, that extends from Maple Avenue to South Quinsigamond Avenue and runs in the North/South directions, Crescent Street, that begins at Maple Avenue and ends at Boston Worcester Turnpike (Route 9), and Maple Avenue, that extends from Main Street to Boston Worcester Turnpike (Route 9) and runs in the East/West directions. The local access roads to the Middle Schools include Sherwood Avenue, Hutchins Street, and Oak Street.

Figure 1 shows the site locus map. The proposed option contains the following design changes:

1. Construct a new building west of the existing building
2. Introduce a new access road to Sherwood Middle School from Crescent Street
3. Reconfigure parking

The construction of an access point off of Crescent Street will shift traffic patterns around the site. Impacts generated by the site will be derived from the change in traffic due to student enrollment and traffic redistribution due to the new access to the proposed building. Figure 2 shows the proposed Sherwood Middle School.

Figure 1 - Locus Map - Existing Sherwood Middle School

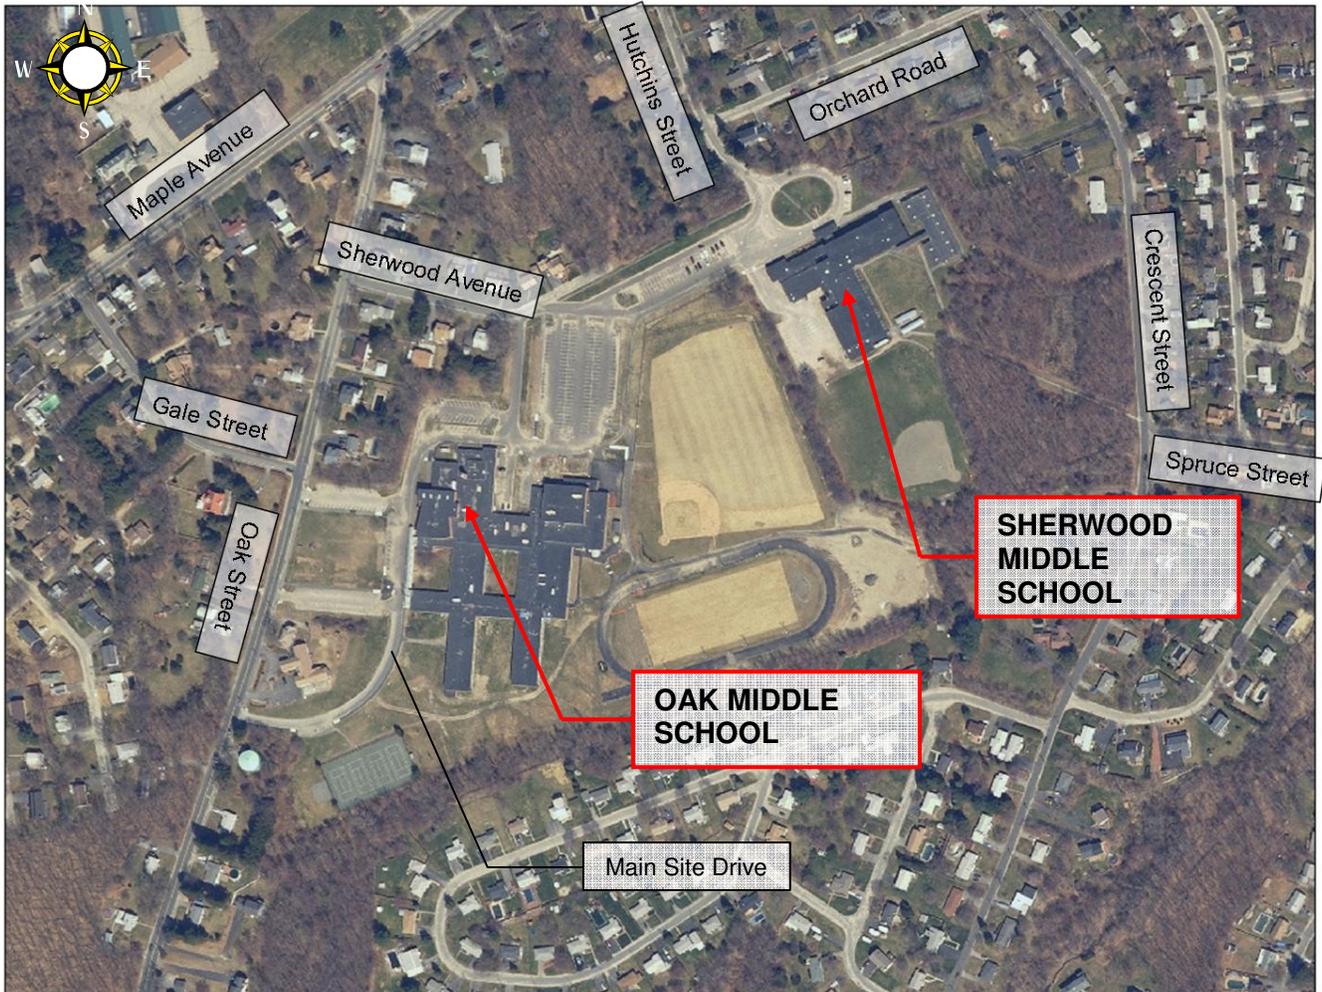

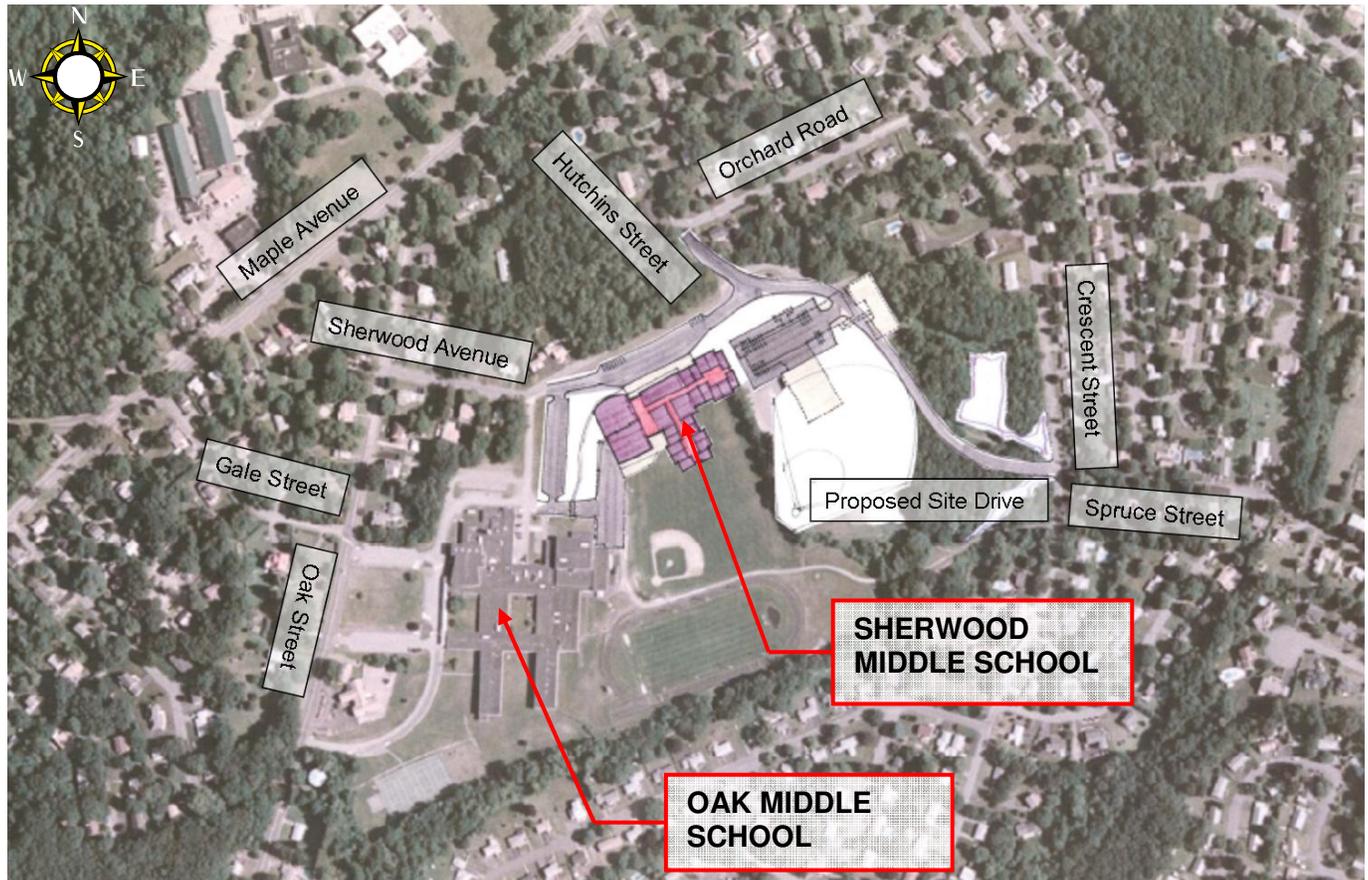

Figure 2 - Proposed - Sherwood Middle School

Proposed Sherwood Middle School New Construction - Oak / Sherwood Connection Option

EXISTING CONDITIONS

Field Reconnaissance

Nitsch Engineering conducted field reconnaissance on Thursday July 30, Wednesday September 16, Thursday September 17, and Monday October 26, 2009 to observe traffic operations, geometric conditions, parking accommodations, pedestrian accommodations, signing, pavement markings, local site access/egress, and overall roadway and intersection conditions.

The following external intersections were included in the study area; all intersections are unsignalized:

- Oak Street/Gale Avenue
- Oak Street/Sherwood Avenue

- Hutchins Street/Orchard Road
- Crescent Street/Spruce Street

In addition, the internal circulation of the site was reviewed, including the intersection of:

- Sherwood Avenue/Site Drive

Below is a description of each of the study area intersections with corresponding photos of the locations.

Oak Street /Gale Avenue

This four-legged unsignalized intersection consists of Oak Street approaching from the north and south, Gale Avenue approaching from the west, and the School Driveway approaching from the East. Gale Avenue intersects Oak Street adjacent to the School Driveway, on the northern side. Cars traveling between Gale Avenue and the School Driveway must turn right and then left, rather than travelling straight through. Along the school side of Oak Street, and along the south side of Gale Street, 4-foot wide sidewalks exist that are separated from the road by a narrow strip of grass. A 6-foot wide crosswalk is marked across Oak Street, between School Street and Gale Avenue. Pedestrian ramps are present on the School Driveway sidewalk, but there are no ramps facing the crosswalk, or on the western side of the street. The pavement is cracked at the end of the crosswalk. There were no speed limit signs posted on any of the approaches.

Oak Street northbound and southbound has a double yellow centerline separating two (2) 14-foot wide travel lanes. There is no shoulder provided from the edge of pavement. We observed warning signs that inform drivers of a school crossing at the intersection. Oak Street allows travel in both directions.

The School Driveway only allows passenger vehicles to travel west towards Oak Street, the only incoming traffic allowed are buses. The School Driveway is 19 feet wide with no lane markings. Gale Avenue is 20 feet wide with no lane markings.

Aside from Oak Street traffic, the primary land uses in the vicinity of this intersection include residential uses.

Oak Street, looking north

Gale Avenue, looking east

Oak Street/Sherwood Avenue

This three-legged unsignalized intersection consists of Oak Street approaching from the north and south and Sherwood Avenue approaching from the east. 4-foot wide sidewalks exist along the east side of Oak Street

and along both sides of Sherwood Avenue separated from the edge of pavement by a narrow strip of grass. Although there are no crosswalks within the intersection, pedestrian ramps are present on both sides of the Sherwood Avenue, but do not comply with MassHighway and ADA guidelines.

Oak Street has a double yellow centerline separating a 15-foot and a 14-foot wide travel lane in the north and southbound directions respectively. No edgeline pavement markings are present. Oak Street allows travel in both directions. At this intersection, Oak Street is the major street; therefore no stop lines are marked on either approach, and there is no stop sign necessary. We observed a warning sign, located north of the intersection, advising drivers to slow for school children. In addition, there are “SLOW” and “SCHOOL” pavement markings on the southbound side of Oak Street. Sherwood Avenue westbound is 24 feet wide with no lane markings. Both streets allow two-way traffic.

Aside from Oak Street traffic, the primary land uses in the vicinity of this intersection include residential uses.

Oak Street, looking north

Sherwood Avenue, looking west

Hutchins Street/Orchard Road

This three-legged intersection consists of Hutchins Street approaching from the north and south, and Orchard Road approaching from the east. Along both sides of the northbound approach of Hutchins Street, and along the south side of Orchard Road is a 6-foot wide sidewalk. A 4-foot wide sidewalk is present along the southbound side of Orchard Road. A wide strip of grass and trees separates the sidewalk and the pavement. Although there are no crosswalks within the intersection, pedestrian ramps are present on both sides of Orchard Road, but do not comply with MassHighway and ADA guidelines.

Hutchins Street has a single white centerline separating 13-foot and 14-foot wide travel lanes in the northbound direction. There is no shoulder provided from the edge of pavement. Hutchins Street allows travel in both directions, but only during off-peak hours. During the hours of 7:00 AM to 8:30 AM, and 2:00 PM to 3:30PM, there is no southbound traffic allowed on Hutchins Street. There is a stop sign and stop line located on both the Hutchins Street northbound and the Orchard Road westbound approaches. There are regulatory signs along the southbound approach of Hutchins Street, restricting traffic during school hours. The speed limit on Hutchins Street is indicated by a 15 mile per hour sign located to the south of the intersection.

Orchard Road is 24 feet wide with no lane markings. We observed a regulatory sign, located on the west side of the intersection, across from Orchard Road, restricting left turns during the hours of 7:00 AM to 8:30 AM, and 2:00 PM to 8:30 PM. Orchard Road allows two-way traffic.

The primary land uses in the vicinity of this intersection are residential uses.

Hutchins Street, looking south

Orchard Road, looking west

Crescent Street/Spruce Street

This three-legged unsignalized intersection consists of Crescent Street approaching from the north and south and Spruce Street approaching from the east. A 4-foot wide sidewalk exists on the north side of Spruce Street and on the east side of Crescent Street, north of Spruce Street, where it is separated from the edge of pavement by a narrow strip of grass. There is a crosswalk across the north side of Crescent Street that goes to a pedestrian walkway into the site. There are no pedestrian ramps present on either side of Crescent Street, and this does not comply with MassHighway and ADA guidelines.

Crescent Street is 23 feet wide and has no double yellow centerline separating travel in the north and southbound directions. No edgeline pavement markings are present. Crescent Street allows travel in both directions. At this intersection, Crescent Street is the major street; there is a stop line marked on the Spruce Street westbound approach, and there is a stop sign facing this approach as well. Spruce Street westbound is 19 feet wide with no lane markings. Both streets allow two-way traffic.

Aside from Crescent Street traffic, the primary land uses in the vicinity of this intersection include residential uses.

Crescent Street, looking south

Spruce Street, looking west

Sherwood Avenue/Main Site Drive

This four-legged unsignalized intersection consists of Sherwood Avenue approaching from the east and west, and the Main Site Drive approaching from the south and southeast. Site Drive intersects Sherwood Avenue in two adjacent locations on the southern side of Sherwood Avenue. Vehicles continuing along the Site Drive in the eastbound direction must turn right, and vehicles continuing in the southbound direction must turn left, rather than travelling straight through the intersection. A 4-foot wide sidewalk is present along both sides of Sherwood Avenue eastbound, and along the north side of Sherwood Avenue westbound. They are separated from the road by a narrow strip of grass. A 6-foot wide sidewalk runs along the edge between the northbound site drive and the westbound site drive. An 8-foot wide crosswalk is marked across the northbound site drive. Pedestrian ramps are present on both ends of the crosswalk, but they do not comply with ADA guidelines. The pavement is cracked along the edges of the sidewalk and in the middle of the intersection. If left unrepaired, this could worsen the pavement conditions and create safety concerns for traffic and pedestrians.

Sherwood Avenue is 24 feet wide and allows two-way traffic, but has no centerline. There is no shoulder provided at the edge of pavement. A Yield sign controls traffic on Sherwood Avenue eastbound.

The northbound site drive is 24-feet wide and allows two-way traffic, but has no centerlines, no stop line, and no shoulders. The westbound site drive is 30-feet wide, and has a white centerline separating traffic into two 15-foot travel lanes, and a stop line is present on the westbound approach. This site drive allows two-way traffic.

This intersection is where bus traffic conflicts with the parent pick-up drop-off traffic. Buses turn right at this intersection from the northbound site drive and continue eastbound towards Sherwood Middle School. In order for them to navigate the turn safely, all other traffic must come to a stop. This causes problems with traffic operations and results in traffic backing up on Sherwood Avenue, onto Oak Street, and eventually Maple Street.

The primary land uses in the vicinity of this intersection are residential uses.

Sherwood Avenue, looking east

Site Drive, looking north

Internal Circulation

There are two key access routes within the site - one is for parent pick-up drop-off, and one is for buses. Buses enter the site from Oak Street, and exit the site at Hutchins Street. Parents can only enter and exit the site from Sherwood Avenue, and must use the designated pick-up/ drop-off area around the edges of parking lot P10.

Site Drive 1 is located along Oak Street and allows one-way traffic eastbound into the site. This drive travels east for about 150 feet before gradually turning north, becoming the main site drive. Site Drive 2 is located about 270 feet to the north of site drive 1. This access point only allows one-way eastbound travel into the school drive. This segment travels east for about 270 feet before intersecting the Main Site Drive. Site Drive 3 intersects Oak Street about 225 feet to the north of Site Drive 2. This driveway intersects Oak Street adjacent to Gale Avenue at its western end, and intersects the Main Site Drive approximately 225 feet east of Oak Street. Site Drive 3 acts as an exit point for passenger vehicles, and an entrance point for buses. However, it is not wide enough for both buses and passenger vehicles to comfortably maneuver simultaneously.

The main site drive continues north 130 feet, where it turns sharply east and splits into two roads. The southern road is one-way eastbound, and the northern road is one-way westbound, creating a loop around two parking aisles (P5 and P6). To the east of the P5 and P6, the Site Drive turns north again for 270 feet before reaching Sherwood Avenue. There is a large parking lot (P7) to the east of this roadway that contains access points at its southern end, across from P5, and at its northern end off of Sherwood Avenue. This parking lot, P7, is the location of the pick-up/ drop-off area.

To the north of P7, the Site Drive continues east towards Sherwood Middle School. Again, the roadway splits around a parking lot (P8) creating a one-way loop. The eastbound traffic travels along the southern end of the parking lot, and the westbound traffic travels along the northern end of the parking lot.

At the eastern end of P8, the site drive ends at a roundabout, with Hutchins Avenue intersecting the roundabout from the north, and the site drive intersecting the roundabout from the west. To the south of the roundabout, in front of the school, is where buses queue for pick-up/ drop-off. There are currently 33 – 35 buses on site, circulating in a staggered fashion.

The existence of multiple one-way roadway sections is confusing to drivers maneuvering through the site. There are missing centerlines on many of the two-way sections, which cause confusion to drivers. Figure 3 shows the names and locations of the parking areas and internal roadways. Figure 4 depicts the internal traffic circulation.

Figure 3 - Parking Locations

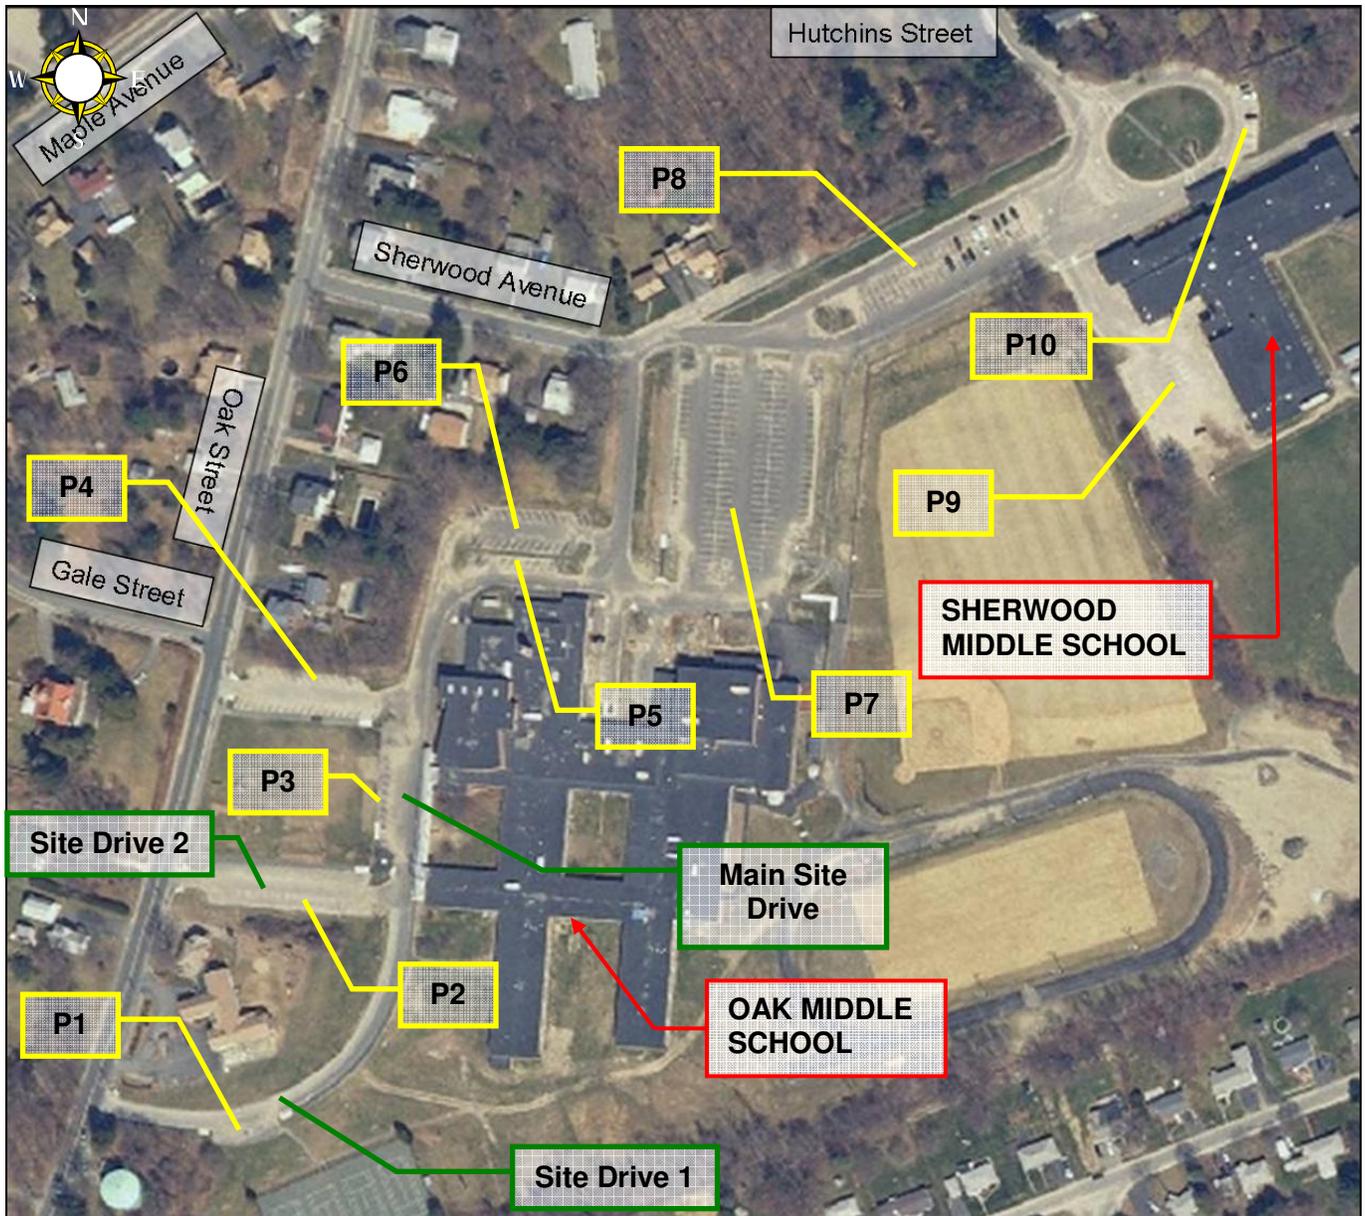

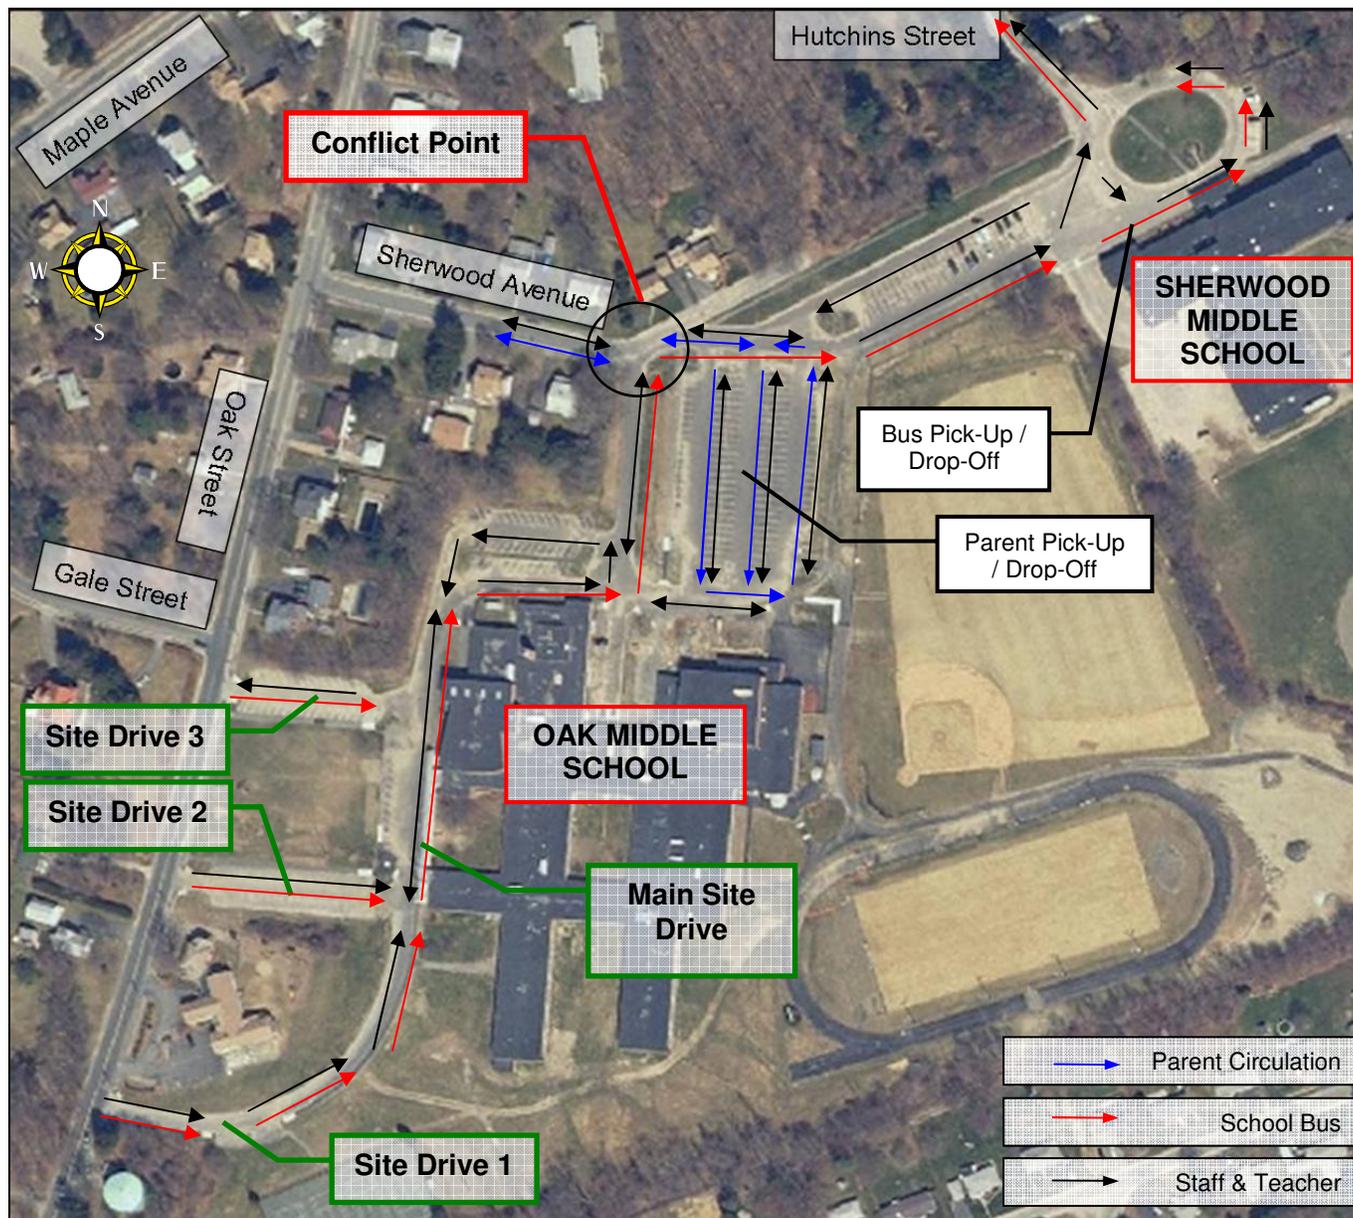

Figure 4 - Circulation

Crash Data

Nitsch Engineering analyzed crash data for the study area intersections. We queried MHD’s crash record database for the Town of Shrewsbury, and identified two (2) crashes in 2006, one is at the intersection of Oak Street and Gale Avenue, and one is at the intersection of Oak Street and Sherwood Avenue. Both crashes involved two vehicles and caused property damage only. No reported crashes occurred at the intersection of Hutchins Street/Orchard Road. We did not check the town police records for any crash information. Typically police records are not available for public use at the level of details shown on the MHD database.

In addition, there were a number of Crashes located at intersections along the school access roads. There were six (6) crashes at the intersection of Oak Street and Maple Avenue. Three (3) crashes occurred in 2005, one (1) crash occurred in 2006, and two (2) crashes occurred in 2007. All of the crashes involved two vehicles. Five (5) of the crashes caused property damage only, and one (1) crash caused a non-fatal injury. There was also one (1) crash in 2007 at the intersection of Hutchins Street and Maple Avenue which involved two cars and caused a non-fatal injury. Two (2) other crashes occurred along Oak Street during this time. One crash occurred in 2006 and was a single-vehicle crash involving property damage only. The other crash occurred in 2007, involving two vehicles and caused a non-fatal injury. Table 1 summarizes the results of the crash analyses.

Table 1 - Crash Summary

Location	Number of Crashes		Severity				Manner of Collision					Percent During	
	Total	Year	PD ^a	PI ^b	NR ^j	F ^c	CM ^d	RE ^e	HO ^f	Ped ^g	Other ^h	Peak Hours	Wet/Icy Conditions
Oak Street/ Gale Avenue	1	2006	1	-	-	-	1	-	-	-	-	100%	0%
Oak Street/ Sherwood Avenue	1	2006	1	-	-	-	-	1	-	-	-	100%	0%
Total	2		2	-	-	-	1	1	-	-	-	100%	0%

^aProperty Damage Only; ^bPersonal Injury; ^cFatality; ^dCross Movement (or angle); ^eRear end; ^fHead on; ^gPedestrian ⁱNot reported or unknown in term of severity; ^hSideswipe, opposite direction; sideswipe, same direction, signal vehicle crash, not reported, unknown etc.

Sight Distance Evaluation

Nitsch Engineering performed a stopping sight distance (SSD) and Intersection sight distance (ISD) evaluation at the intersection of Crescent Street and Spruce Street. SSD is the minimum visibility required for a vehicle on the major street to observe the presence, and safely stop the vehicle to prevent collision with an object/vehicle from the minor street. ISD is the minimum visibility for a vehicle stopped on the minor street to observe and assess the major street traffic to enter the intersection. We used the Project Development and Design Guide¹ to establish the required minimum SSD and ISD. We used the Existing Conditions Plan, prepared by Waterman Design Associates, Sheet CO.04, along with Ortho imagery from Google Earth to determine the available SSD and ISD.

¹ Project Development and Design Guide, Massachusetts Highway Department, 2006

Table 2 - Sight Distance Evaluation

Intersection	Posted Speed Limit	Stopping Sight Distance (SSD)		Intersection Sight Distance (ISD)	
	Speed ¹ (in mph)	Required ²	Available ³	Required	Available
Crescent Street/Spruce Street					
Crescent Street, south of Intersection	25	115	310		
Crescent Street, north of Intersection	25	115	395		
Spruce Street, looking left	25*			280	330
Spruce Street, looking right	25*			240	285

¹ Posted in miles per hour (mph).
² Required in feet (ft) - Project Development and Design Guide, Massachusetts Highway Department, *Chapter 3 – Basic Design*
³ Measured in feet (ft), rounded to the nearest five feet
 * Speed limit assumed based on cross street speed limit and area characteristics.

As seen from Table 2, the available SSD and ISD exceeds the required minimum. Additionally, there were no crashes at this intersection from 2005-2007, which does not indicate safety deficiencies from lack of sight distance.

2009 Existing Traffic Data

Nitsch Engineering collected Turning Movement Counts (TMCs) on Wednesday September 16 and Thursday September 17, 2009 while school was in session. The TMC data was collected from 7:00 AM to 9:00 AM, during school drop-off session, and from 2:15 PM to 4:15 PM, during school pick-up session. The data collected included all vehicle volumes at the intersection of Sherwood Avenue and the Site Drive. This intersection is the conflict point in Figure 4.

The traffic consists of three groups, buses, parent pick-up/drop-off, and employees. The buses come from the south (Site Drive) and turn east to continue on toward Sherwood Middle School. The incoming pick-up/drop-off traffic comes from the west, and turns right into the designated parking area. The outgoing pick-up/drop-off traffic comes from the parking lot to the south of the intersection, and generally turns left to exit via Sherwood Avenue. Some traffic turns right and continues through the site to Hutchins Street, although this movement is prohibited. The incoming employees generally come in from Sherwood Avenue, and continue straight through the site towards the teacher parking lot. The outgoing employees come from the eastern Site Drive and continue straight onto Sherwood Avenue.

Based on the data collected, the AM peak hour at the Sherwood Avenue and Site Drive intersection occurs from 7:15 AM to 8:15 AM and the PM peak hour occurs from 2:15 PM to 3:15 PM. During the pick up period in the afternoon, many vehicles come early and wait for the students, so the peak hour for the incoming traffic does not correspond to the peak hour for the outgoing traffic. The outgoing traffic indicates the total number of students picked up and the exiting traffic from the parking lot, since some of the vehicles had arrived before the counts took place. This includes all the pick-up/ drop-off traffic, all the bus traffic, and a portion of the employee traffic for both Sherwood and Oak Middle Schools.

Table 3 shows the breakdown of traffic at this intersection during the peak hours. This includes all the pick-up/ drop-off traffic, all the bus traffic, and a portion of the employee traffic for both Sherwood and Oak Middle Schools.

Table 3 - TMC Data Summary

Time Period	Buses	Incoming Pick-Up/ Drop-Off	Outgoing Pick-Up/ Drop-Off	Incoming Employees	Outgoing Employees
AM Peak 7:15 AM – 8:15 AM	35	217	183	74	15
PM Peak 2:15 PM – 3:15 PM	32	93	130	28	36

In addition to TMCs, there were Automatic Traffic Recorder (ATR) counts taken from September 17 to September 20, 2009. The ATR data included 96-hour continuous traffic counts on Oak Street, Crescent Street, and Sherwood Avenue. Oak Street and Sherwood Avenue are access roads to the middle school campus. Crescent Street is the location of a future access road. Hutchins Street allows only outgoing traffic, and was not included in the study due to the low volume of traffic and unchanging nature of the access. Table 4 provides a summary of our observations.

Table 4 - Peak Hour and Daily (Weekday) Traffic Volumes by Location

Location	School AM Peak		School PM Peak		ADT ¹ (vpd)	“k” factor	Direction	Directional Distribution
	Hour	Volume	Hour	Volume				
Oak Street -north of Sherwood Avenue	7:45 – 8:45	549	2:45 – 3:45	395	3,742	0.15	NB/SB	AM: 43%/57% PM: 51%/49% DAILY: 49%/51%
Crescent Street -north of Spruce Street	7:15 – 8:15	160	2:15 – 3:15	147	1,772	0.09	NB/SB	AM: 39%/61% PM: 32%/68% DAILY: 34%/66%
Sherwood Avenue -east of Oak Street	7:15 – 8:15	502	2:30 – 3:30	305	1,294	0.39	EB/WB	AM: 63%/37% PM: 54%/46% DAILY: 61%/39%

¹Average Daily Traffic

Table 4 indicates that the volumes on Oak Street are approximately twice as high as the Crescent Street volumes, which are approximately 30% higher than Sherwood Avenue volumes, except during the peak hours, when volumes on Sherwood Avenue are significantly higher than those on Crescent Street. The Highway Capacity Manual (HCM) defines the k-factor as the percentage of daily traffic flowing during the single highest peak hour on an average day. Engineers use the k-factor to compute crash rate at an intersection in the absence of field data. The k-factors on Oak Street, Crescent Street, and Sherwood Avenue were 0.15, 0.09, and 0.39 respectively. The normal range of k-factors is 0.07 to 0.11. Both Oak Street and Sherwood Avenue have a greater than normal k-factor. This is due to the school peak hours creating a spike in volumes on streets which otherwise experiences low volumes.

Directional distribution of traffic on Oak Street is 49% traveling northbound and 51% traveling southbound. Oak Street and Crescent Street are a local roads providing access to Maple Avenue in the north and Route 9 in the south. Except during school peak hours, Nitsch Engineering anticipates traffic on Oak Street to be cut-through traffic from Route 9 to access points east and west on Maple Avenue. Directional distribution on Crescent Street is 34% traveling northbound and 66% traveling southbound. During the school AM peak hour, we observed 61% of traffic heading south on Crescent Street. During the school PM peak hour, we observed 68% of traffic heading south on Crescent Street indicating a more balanced distribution during the AM peak hour than the PM peak hour. Sherwood Avenue is a local road that provides access from Oak Street to Oak Middle School and Sherwood Middle School. Nitsch Engineering anticipates traffic on

Sherwood Avenue to be primarily school related at all hours of the day, with minimal residential and cut-through traffic. Directional distribution on Sherwood Avenue shows 61% travelling eastbound and 39% travelling westbound. This is because traffic can exit the school site via both Sherwood Avenue and Hutchins Street, but traffic can only enter the site from Sherwood Avenue during school hours.

Based on the ATR data, the AM peak hour on Oak Street is from 7:45 to 8:45 AM and the PM peak hour is from 2:45 to 3:45 PM. The AM peak hour on Crescent Street is from 7:15 to 8:15 AM. We observed the PM peak traffic to be from 5:15 PM to 6:15 PM. The PM peak period on Crescent Street also experienced a spike from 2:15 to 3:15 PM coinciding with the school PM peak hour, but the volumes during 5:15 to 6:15 PM were slightly higher than the school peak hour volumes. The AM peak hour on Sherwood Avenue occurs between 7:15 and 8:15 AM, and the PM peak occurs between 2:30 and 3:30 PM. This is fairly consistent with the peak hour determined by the turning movement counts taken on Sherwood Avenue.

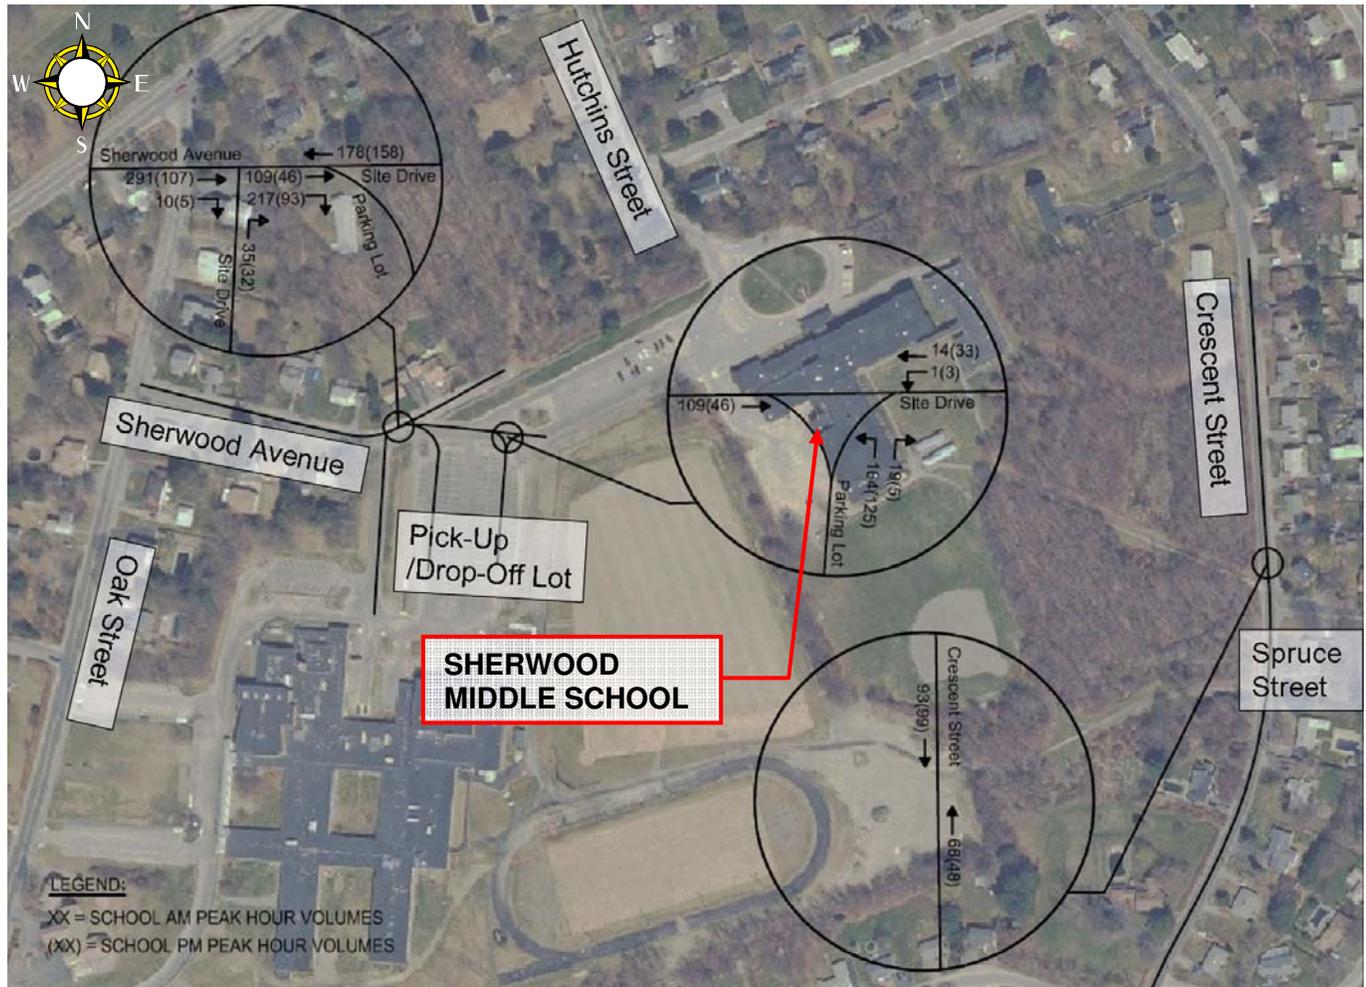

The Average Daily Traffic (ADT) during the weekday on Oak Street, Crescent Street, and Sherwood Avenue is 3,742 vehicles per day (vpd), 1,772 vpd, and 1,294 vpd respectively. With the proposed school construction, we anticipate the daily traffic on Crescent Street to increase during peak hours, based on a new entrance to the school off of Crescent Street. There will also be a decrease in traffic on Oak Street and Sherwood Avenue during peak hours due to a shift in traffic to Crescent Street.

Seasonal Adjustments

Traffic volumes fluctuate monthly throughout the year. Based on regular traffic counts at MassHighway's permanent count stations, adjustment factors can be calculated and applied to existing traffic counts to meet average-month volumes. The data from MassHighway's count stations from 2006² indicate that the average volumes in August are slightly higher than the yearly average. We did not adjust the traffic counts, in order to remain conservative. Figure 5 shows the existing traffic volumes.

² Massachusetts Highway Department (MHD) Traffic Volume Counts, Monthly ADT Comparisons, 2006.

Figure 5 - 2009 Existing Traffic Volumes

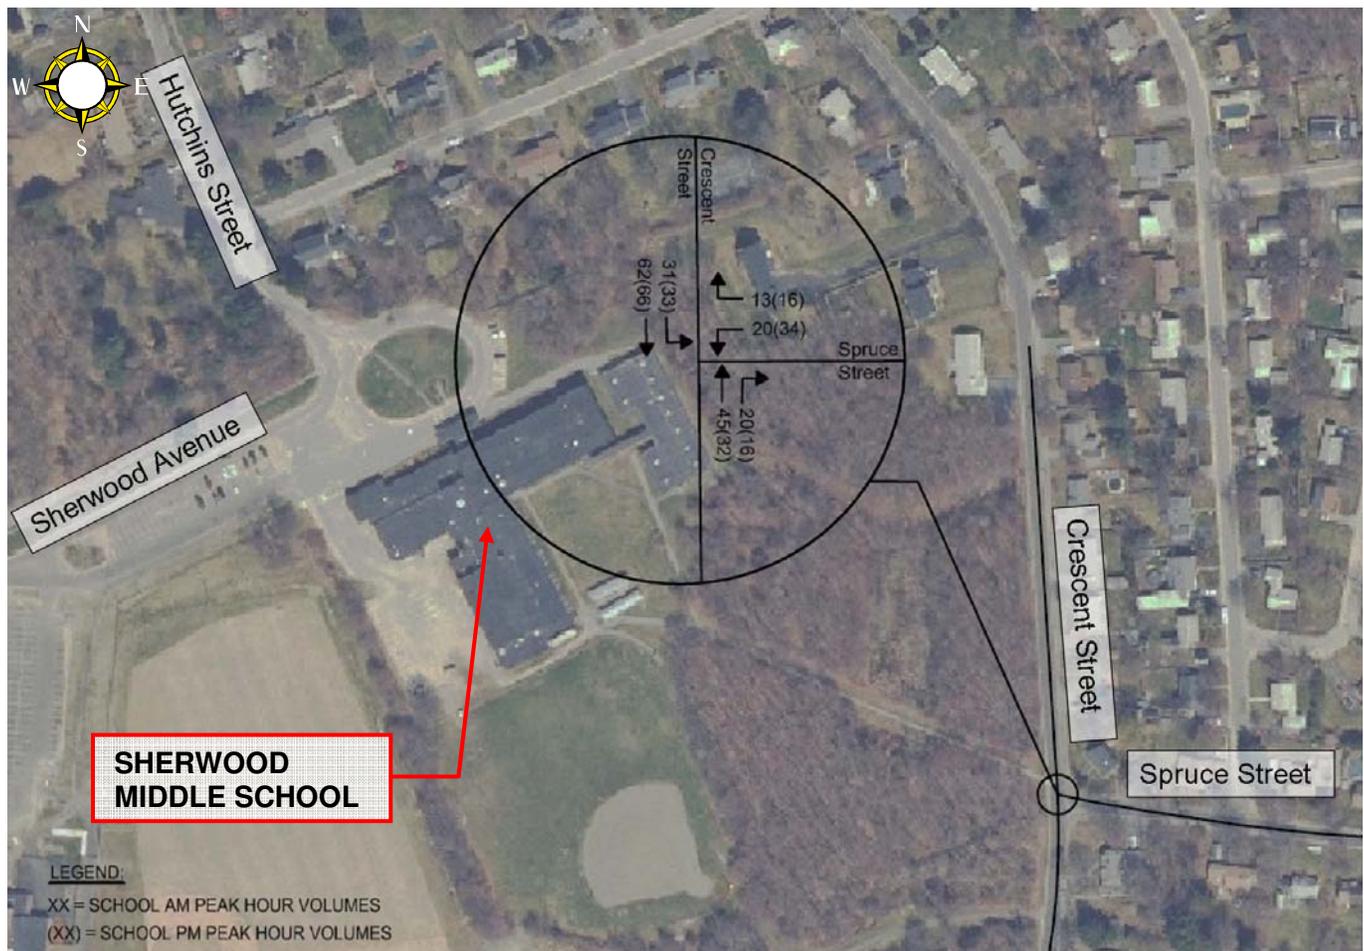

Spruce Street Redistribution

The traffic counts on Crescent Street were taken to the north of the intersection with Spruce Street. In order to analyze the intersection of Crescent Street at Spruce Street, assumptions were made about the volume of traffic on Spruce Street. Spruce Street is a local roadway connecting Crescent Street and Lake Street. Traffic travelling northbound on Crescent Street consists of residential traffic and traffic from Route 9. Traffic travelling westbound on Spruce Street consists of residential traffic, and traffic from Lake Street and Edgewood Road.

As seen in Figure 5, volumes on Crescent Street are low, particularly in the northbound direction, which is the direction that contains the traffic from Spruce Street. Low traffic volumes indicate that Crescent Street is not a preferred route for cut-through traffic. This suggests that a significant portion of the traffic travelling northbound on Crescent Street is residential in nature. Crescent Street, south of Spruce Street, is approximately twice as long, with two times as many residences as Spruce Street. Therefore, one third of the traffic on Crescent Street travelling northbound was assigned to Spruce Street, with two thirds remaining on

Crescent Street. Figure 5 also indicates that the directional split on Crescent Street favors the southbound direction, with 61% of all traffic travelling southbound during the AM peak hour and 68% travelling southbound during the PM peak hour. The same split was used for Spruce Street, to assign traffic turning left from Spruce Street westbound onto Crescent Street southbound, and traffic turning right from Crescent Street northbound onto Spruce Street eastbound. Figure 6 shows the 2009 volumes redistributed at Crescent Street and Spruce Street.

Figure 6 - 2009 Redistributed Traffic Volumes

Intersection Operations

Highway Capacity Software Methodology

We conducted a Level of Service (LOS) analysis at the study area intersections using the procedures outlined in the 2003 Highway Capacity Manual (HCM)³. The intersections were analyzed using SYNCHRO Version 6 computer software, which is accepted by MHD as a standard procedure. The HCM bases its LOS results solely on average vehicle delay. MassHighway considers, LOS A – D as acceptable in urban/suburban areas, and LOS E and LOS F as unacceptable.

² 2003 Highway Capacity Manual; Transportation Research Board.

The intersection of Sherwood Avenue at the Site Drive is not a typical intersection. The turning movements occur at two different locations along the Site Drive. In order to analyze it in Synchro it was split into two intersections, Sherwood Avenue at Site Drive (West) and Sherwood Avenue at Site Drive (East). The western intersection was analyzed as an all-way stop. The eastern intersection was analyzed as a traditional unsignalized intersection with a free movement in the eastbound and westbound direction, and a stop control on the northbound approach.

Crescent Street and Spruce Street was analyzed as a three legged, unsignalized intersection with a stop control on the westbound approach of Spruce Street. Table 5 summarizes the 2009 existing condition traffic operations.

Table 5 - Level of Service Summary - 2009 Existing Condition

Intersection	Movement/Approach	Weekday School AM Peak Hour		Weekday School PM Peak Hour	
		LOS ¹	Delay ² (sec)	LOS	Delay (sec)
Sherwood Avenue and Site Drive (West)	Eastbound	A	9.9	A	7.9
	Westbound	A	8.8	A	8.2
	Northbound	A	9.6	A	8.9
Sherwood Avenue and Site Drive (East)	Westbound Left	A	0.5	A	0.6
	Northbound	B	11.6	B	10.1
Crescent Street and Spruce Street	Westbound Left	A	9.4	A	9.5
	Southbound	A	2.6	A	2.6

¹ LOS = level of service
² Average delay in seconds per vehicle

The traffic at the intersection of Sherwood Avenue and Site Drive is not very high; therefore the LOS is adequate by Mass Highway standards. This analysis shows that the volume of traffic is not the cause of the queuing observed in the field. However, the organization of the pick-up/drop-off and the layout of the intersection are very confusing to drivers. This forces drivers to react slowly, and causes traffic to back up. Additionally, every time a bus turns right at this intersection, all traffic must stop in order for them to maneuver safely. The intersection is unsignalized, but it is controlled by school employees directing traffic. This is necessary to control the flow of traffic through the intersection and prevent collisions.

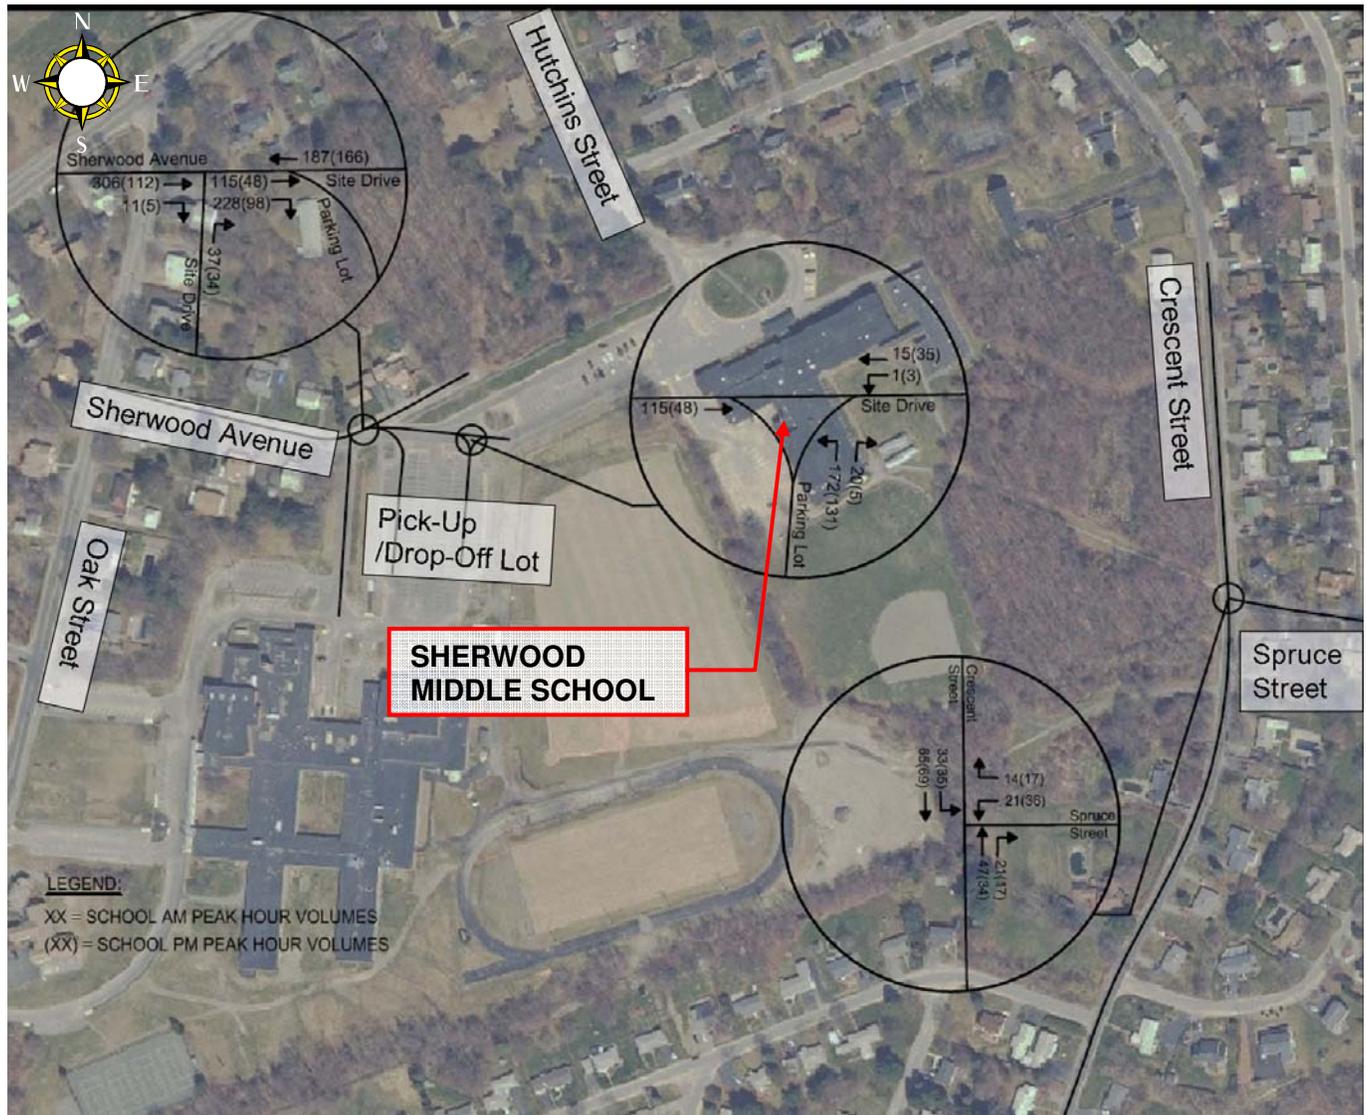

The existing LOS at Crescent Street and Spruce Street is adequate by Mass Highway standards for both the AM and PM peak periods.

2014 No-Build Traffic Volumes

Nitsch Engineering used data from MassHighway’s traffic volume counts to determine the background growth in the Town of Shrewsbury⁴. Based on the Average Annual Daily Traffic (AADT) data available, the traffic volumes at count station 3125 on Oak Street, north of Route 9 saw a -2% volume change between 1999 and 2005. However, in order to remain conservative Nitsch Engineering used a background growth rate of 1%. We applied the background growth factor to the 2009 existing traffic volumes to develop the 2014 traffic volumes. The five-year time frame conforms to the Executive Office of Environmental Affairs/Executive Office of Transportation (EOEA/EOT) guidelines for traffic impact assessments.

⁴ Massachusetts Highway Department, City/Town Traffic Volume Count Listing, 2007

Figure 7 - 2014 No-Build Traffic Volumes

Nitsch Engineering performed a Level of Service analysis using the 2014 No-Build volumes. Table 6 summarizes the results of the 2014 No-Build condition LOS analysis.

Table 6 - Level of Service Summary - 2014 No-Build

Intersection	Movement/Approach	Weekday School AM Peak Hour		Weekday School PM Peak Hour	
		LOS ¹	Delay ² (sec)	LOS	Delay (sec)
Sherwood Avenue and Site Drive (West)	Eastbound	B	10.2	A	7.9
	Westbound	A	8.9	A	8.3
	Northbound	A	9.7	A	9.0
Sherwood Avenue and Site Drive (East)	Westbound Left	A	0.5	A	0.6
	Northbound	B	11.9	B	10.2
Crescent Street and Spruce Street	Westbound Left	A	9.5	A	9.6
	Southbound	A	2.6	A	2.6

¹ LOS = level of service
² Average delay in seconds per vehicle

The analysis indicates that there would be a minor degradation in LOS (from LOS A to LOS B) on the eastbound approach of Sherwood Avenue and Site Drive (West) in the AM peak for the No-Build conditions when compared to the Existing conditions. It is still an acceptable LOS by Mass Highway Standards.

PROPOSED SHERWOOD MIDDLE SCHOOL

The proposed Sherwood Middle School will be built to the west of the existing middle school, on the existing P7 parking lot and the fields to the east of the lot. The new building will be fully constructed before the old building is demolished. The parking lots at P7, P8, P9, and P10 will be demolished, and replaced with new lots. There will be a new access point to the site off of Crescent Street, across from Spruce Street. The access to Hutchins Street and Sherwood Avenue will be reconfigured.

Oak Middle School will remain unchanged during construction of Sherwood Middle School. The existing site access off of Sherwood Avenue will be reconfigured due to the proposed development.

Vehicle Trip Generation

A typical component of traffic impact studies is a trip generation forecast for the project. Such forecast is based on either established data compiled by the Institute of Transportation Engineers (ITE)⁵ or on existing vehicle counts to determine a trip generation rate. Nitsch Engineering used ITE data for trip generation (under Land Use Code (LUC) 522 – Middle School/Junior High School) to estimate the proposed trips to the middle school. The school enrollment as of October 2008 was 917 students, with 123 staff during the 2008-2009 school year. The proposed school will accommodate 900 students.

Using the proposed student population of approximately 900 students, Table 7 below shows school-generated peak hour trips calculated using ITE trip data for middle schools. The volumes only show the traffic associated with Sherwood Middle School, and does not include the traffic for Oak Middle School. This data was used rather than the existing counts, because the existing counts only included the traffic at Sherwood Avenue and Site Drive, and did not include the traffic volumes at other site drives. The trip generation includes all pick-up/ drop-off, employee, and bus traffic.

⁵ *Trip Generation, Seventh Edition*; Institute of Transportation Engineers; Washington, D.C.; 2003

Table 7 - Trip Generation - Sherwood Middle School

Time Period	ITE Volumes ³		
	In	Out	Total
School AM Peak Hour	267	219	486
School PM Peak Hour	126	153	279

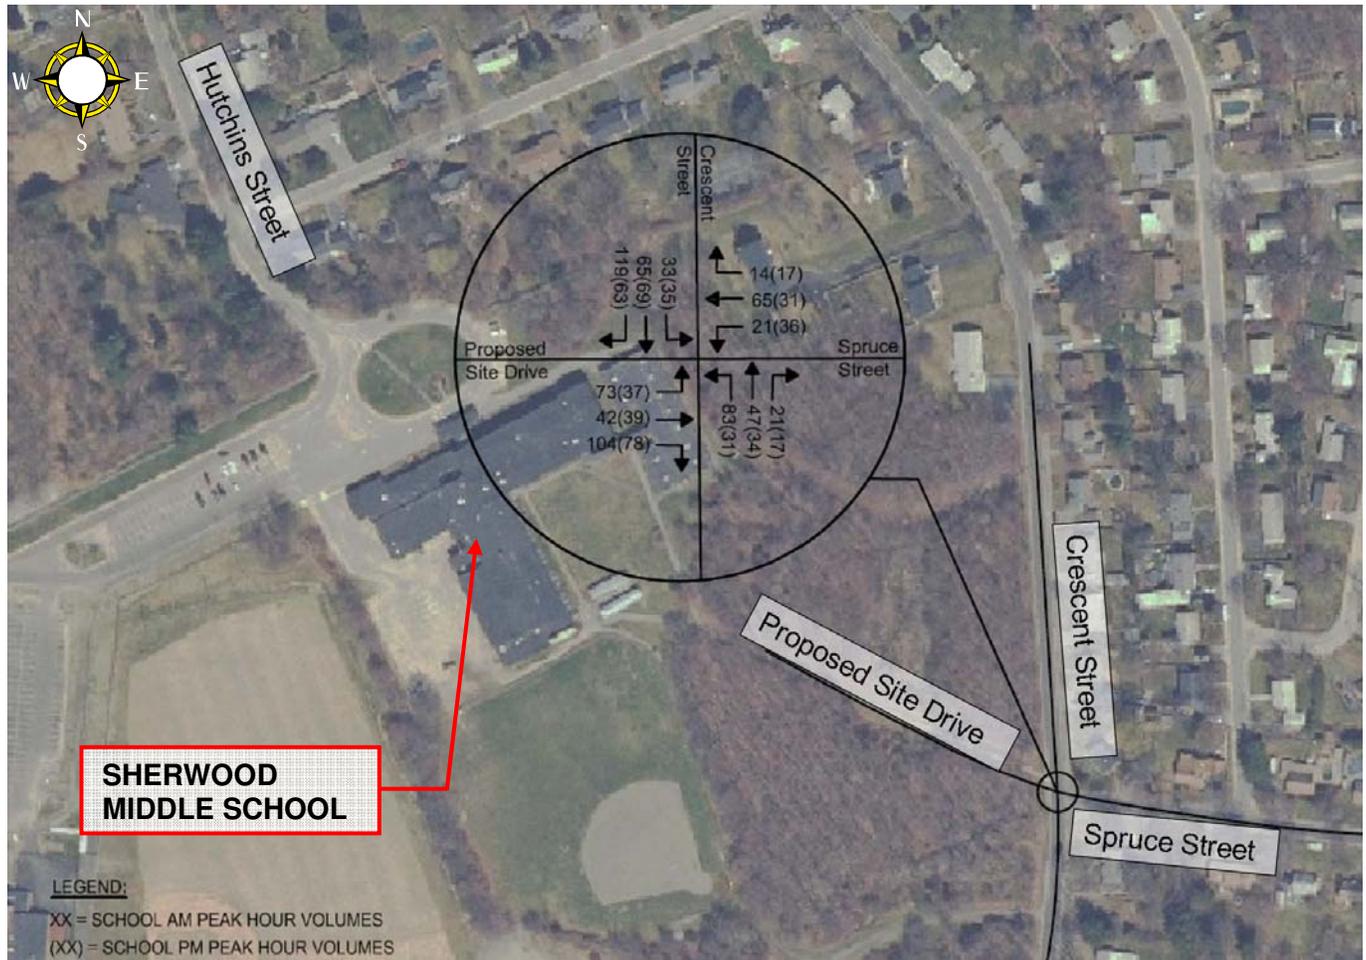

2014 Build Traffic Volumes

There are multiple site drives to the proposed Sherwood Middle School. The incoming and outgoing traffic will be split between the various site drives. For the traffic analysis, Nitsch Engineering assigned all school trips for the proposed school to the intersection of Crescent Street and the Proposed Site Drive to establish a conservative 2014 Build condition. The Proposed Site Drive intersects Crescent Street across from Spruce Street. Nitsch Engineering used trip distribution patterns from the existing (redistributed) traffic volumes to determine the trip distribution for the proposed school. The percentages are shown in Table 8. Significantly less traffic will be using the existing site entrance off of Sherwood Avenue. Since the intersection of Sherwood Avenue and Site Drive achieves an acceptable LOS under existing and no-build conditions, it was not analyzed with a reduction in traffic under build conditions. Figure 8 shows 2014 traffic volumes with the assigned school trips.

Table 8 - Trip Distribution - Sherwood Middle School

Time Period	Incoming			Outgoing		
	NB	SB	WB	NB	SB	EB
School AM Peak Hour	31%	44%	24%	34%	47%	19%
School PM Peak Hour	24%	51%	25%	24%	51%	25%

Figure 8 - 2014 Build Traffic Volumes

2014 Build Level of Service Analysis

Nitsch Engineering performed a Level of Service analysis using the 2014 Build condition traffic network. The intersection of Crescent Street, Spruce Street, and the Proposed Site Drive was analyzed as a four legged, unsignalized intersection with stop control on the eastbound (Site Drive) approach and the westbound (Spruce Street) approach and no control on Crescent Street. Table 9 summarizes the results of the 2014 Build condition LOS analysis.

Table 9 - Level of Service Summary - 2014 Build Condition

Intersection	Movement/Approach	Weekday School AM Peak Hour		Weekday School PM Peak Hour	
		LOS ¹	Delay ² (sec)	LOS	Delay (sec)
Crescent Street and Proposed Site Drive	Eastbound	C	16.3	B	11.6
	Westbound	C	16.2	B	12.7
	Northbound	A	4.5	A	3.0
	Southbound	A	1.3	A	1.7

¹ LOS = level of service; ² Average delay in seconds per vehicle

The proposed site drive on Crescent Street maintains an acceptable LOS by Mass Highway standards. In addition, the layout of the intersection is straightforward and does not require the presence of school employees to direct traffic flow. Buses would be prohibited at this access point. This would simplify the pick-up/drop-off and reduce congestion at the existing Site Drive on Sherwood Avenue. A signal warrant analysis at this intersection is not required because the volume of traffic is very low.

PARKING ASSESSMENT

Nitsch Engineering observed parking activities on Thursday, July 30 to determine the current number of parking spaces available. There are a number of different parking areas throughout the site that are shared with the Oak Middle School. The location of the parking lots is shown in Figure 3. Table 10 summarizes the existing parking supply at Sherwood and Oak Middle Schools.

Table 10 - Existing Parking Supply

Lot	P1	P2	P3	P4	P5	P6	P7	P8	P9	P10	TOTAL
Total Spaces	9	41	11	30	11	28	167	58	36	8	399
Handicap Spaces		3	4				2			3	12

During our site visit, we observed 399 general parking spaces and twelve (12) handicap accessible spaces. There are presently 399 parking spaces for approximately 1870 (920 Sherwood Middle School, 950 Oak Middle School) students, generating a parking ratio of 0.21 spaces per student.

The ITE Parking Generation Manual⁶ suggests a parking ratio of 0.11 spaces per student, or 1.6 spaces per employee for a Junior/High School. Applying this parking ratio to a student population of 900, the required parking spaces for the Sherwood Middle School would be 99 spaces. Applying a parking ratio of 1.6 spaces per employee for 123 employees, the Sherwood Middle School would require 197 spaces.

Oak Middle School has approximately 950 students and 112 employees. Applying the same parking ratios listed above, the required parking spaces would be 105 based on the student population and 180 based on the number of employees. Using the most conservative estimates, the total number of required parking spaces for both schools is 377.

⁶ Institute of Transportation Engineers, Parking Generation, 7th Edition, LUC 522 Middle, Junior/High School

The proposed parking supply is generally higher than the parking demand if we use the existing and ITE's parking ratio. The local zoning for the Town of Shrewsbury requires one (1) parking space for each classroom or office and one (1) parking space for each three (3) seats in an auditorium, whichever is greater. Based on the proposed school size, we anticipate that the total number of required parking spaces would not exceed 377.

CONCLUSIONS/ RECOMMENDATIONS

The existence of multiple one-way roadway sections is confusing to drivers maneuvering through the site. There are missing centerlines on many of the two-way sections, which makes it hard to differentiate between one-way and two-way roadways. The existing configuration of Sherwood Avenue and Site Drive is confusing to drivers and requires attention. School employees are being used to direct traffic flow during the morning and afternoon hours. The buses conflict with the pick-up/ drop-off and employee traffic. This causes extensive queuing on Sherwood Avenue and the Site Drive.

With the proposed school construction, we anticipate the daily traffic on Crescent Street to increase during peak hours, based on a new entrance to the school off of Crescent Street. There will also be a decrease in traffic on Oak Street and Sherwood Avenue during peak hours due to a shift in traffic to Crescent Street. The existing traffic volumes on Crescent Street are low, and should be able to accommodate a shift in traffic without compromising on safety and capacity. Crescent Street is similar in nature and function to Oak Street with access to Route 9 and Maple Street. Redistributing traffic from Oak Street to Crescent Street would not disrupt existing traffic routes for motorists.

The existing parking capacity is sufficient, and any proposals should retain the current number of parking spaces.

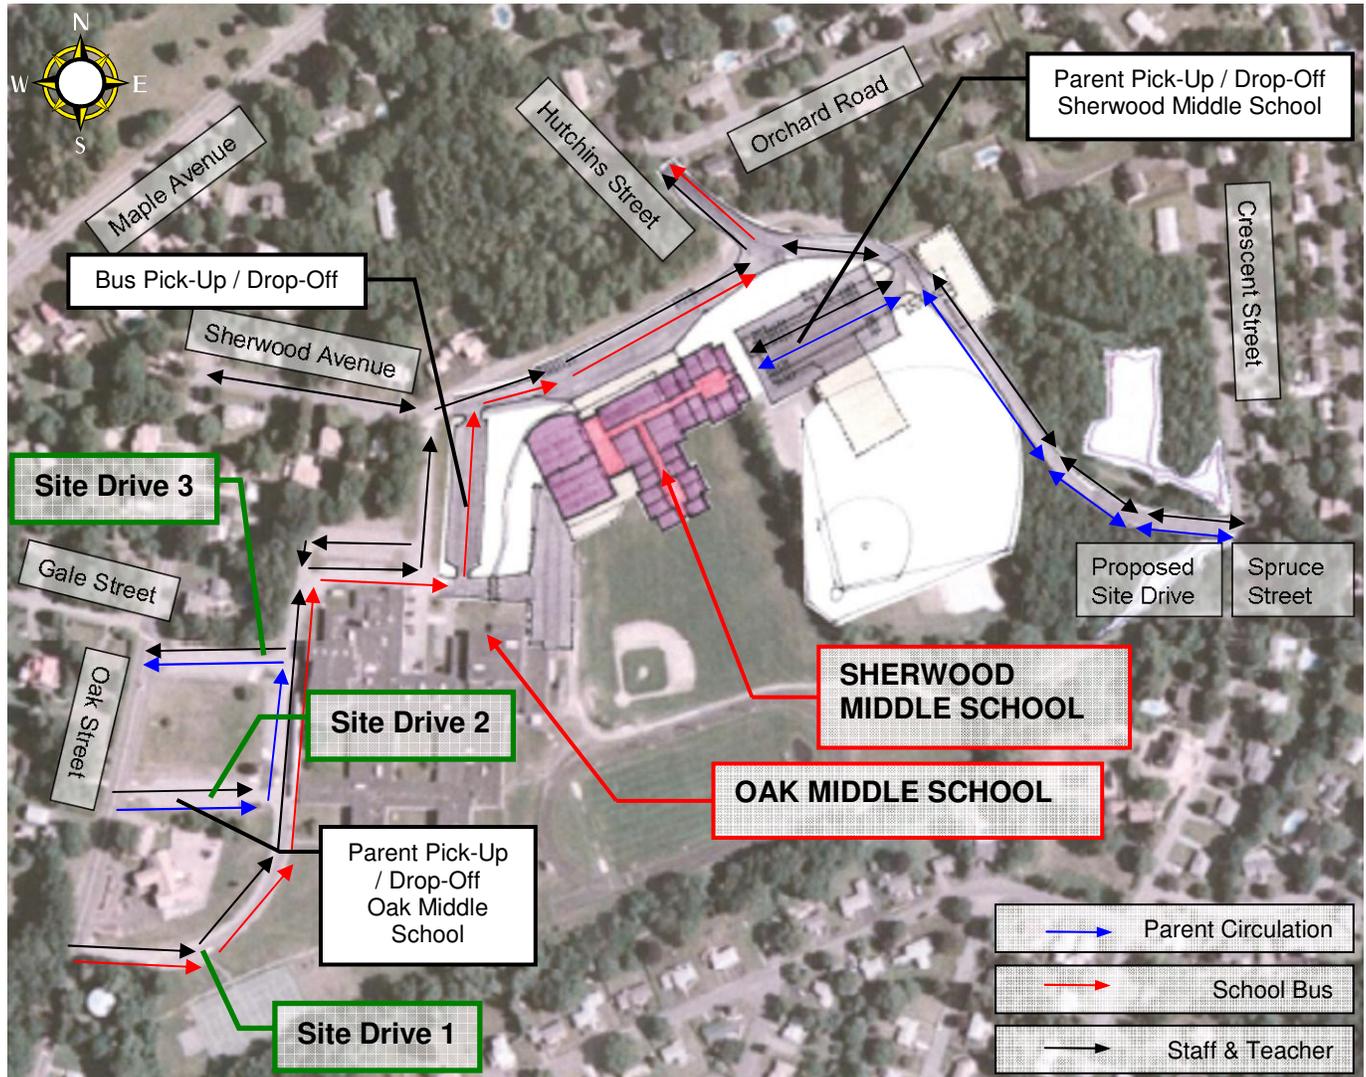

Nitsch Engineering makes the following recommendations to reduce delays, enhance safety, and improve efficiency of traffic operations within the Sherwood Middle School campus.

- Move the Sherwood Middle School pick-up/ drop-off to the east side of the proposed school building to reduce conflicts at the intersection of Sherwood Avenue and Site Drive.
- Provide a single school bus pick-up/ drop-off area for both Oak Middle School and Sherwood Middle School to improve the efficiency of the school bus circulation. This should be located at the new parking lot that replaces P7.
- Relocate the Oak Middle School parent pick-up/ drop-off to the parking areas at Site Drive 2 and Site Drive 3 near Oak Street. This would provide an improved flow of traffic for vehicles entering and exiting the site.
- Provide signage and pavement markings to the north and south of the new access point off of Crescent Street, notifying drivers that they are in a school zone.
 - A warning sign should be introduced advising drivers to slow down for school children.
 - Pavement markings "SLOW" and "SCHOOL", similar to the existing markings on Oak Street, should be introduced on Crescent Street.

With these changes we anticipate a majority of conflicts between buses and pick-up/ drop-off traffic to be eliminated, and the pick-up/ drop-off traffic to get split between Oak Street and Crescent Street.

Figure 9 shows the proposed pick-up/ drop-off locations and circulation changes.

Figure 9 - Recommendations

MEMORANDUM

TO: Lamoureux Pagano Associates c/o Ms. Kathryn Crockett, AIA
FROM: Aaron Gallagher, P.E, LEED AP
DATE: 12/01/2009
RE: Proposed Site/Drainage Features and Permitting Issues

The following memorandum outlines some of the site/drainage features and permitting issues associated with the schematic design documents prepared by Nitsch Engineering (dated 11/17/2009) for the new Sherwood Middle School project:

SITE / DRAINAGE FEATURES

WETLAND REPLICATION AREA

The proposed Sherwood Middle School will permanently affect approximately 2,500 square feet of bordering vegetated wetlands (BVW) subject to regulation by the Shrewsbury Conservation Commission pursuant to the MA Wetlands Protection Act (WPA; MGL Chapter 131, Section 40) and associated regulations (310 CMR 10.00 et. seq.). To compensate for project-related impacts to wetlands, approximately 5,000 SF of uplands onsite will be converted to a mixture of emergent and scrub/shrub wetland communities.

Prior to construction, the boundaries of wetlands will be re-flagged, as will the limits of construction, to preclude unnecessary disturbances. To limit the amount of sediment transported off site by construction vehicles, a stabilized construction entrance/exit will be established. Soil erosion and sedimentation will be minimized by the use of hay bales and silt fences to isolate the construction zone. The installation of soil erosion and sediment controls will comply with the Massachusetts Erosion and Sediment Control Guidelines for Urban and Suburban Areas (Franklin, Hampden, Hampshire Conservation Districts; March 2003). These controls will be inspected and maintained periodically, as required, until such time that their removal is approved by the Shrewsbury Conservation Commission (SCC).

In addition to requiring that the surface area of affected BVW be replaced by a 2:1-sized compensation area, the WPA regulations at 310 CMR 10.55(4)(b) require the following:

- The ground water and surface elevation of the replacement area shall be approximately equal to that of the lost area;
- The overall horizontal configuration and location of the replacement area with respect to the bank shall be similar to that of the lost area;
- The replacement area shall have an unrestricted hydraulic connection to the same water body or waterway as the lost area; and
- At least 75% of the surface of the replacement area shall be reestablished with indigenous wetland plant species within two growing seasons, and prior to said vegetative reestablishment any exposed soil in the replacement area shall be temporarily stabilized to prevent erosion in accordance with standard U.S. Soil Conservation Service methods.

TO: Lamoureux Pagano Associates, Nitsch Project # 7683

Date: December 1, 2009

Page 2 of 5

The wetland restoration plan for the site should comply with each of the construction-related requirements listed above. It also is anticipated that within two growing seasons following construction of the proposed replication areas, at least 75% of the surface of these areas will be reestablished with indigenous wetland plant species.

With respect to the implementation of wetland replication activities, it is recommended that the Contractor retain the services of a qualified Wetland Scientist to oversee and monitor replication site construction, and to adjust the replication plan depending upon site-specific conditions revealed during the construction process, as may be required.

Replication Site Preparation

Following the installation of soil erosion and sediment controls, debris and existing vegetation within the wetland replication areas will be cleared. The replication sites then will be over-excavated by a minimum of 12 inches relative to the elevations of adjacent wetlands. Excavated materials shall be removed to a location beyond the 100-foot Buffer Zone to the wetland area.

Subsequently, each replication area will be back-filled with 12 inches or more of organic-rich soils. These soils will consist of natural topsoil consisting of loam as defined by the U.S. Department of Agriculture/Natural Resources Conservation Service (NRCS) and will be placed within the over-excavated portion of the wetland replication area to attain final grades, as indicated on the grading plans. The loam to be used at the wetland replication sites will have an organic carbon content on a dry weight basis of 8% - 12% (13.76% – 20.64% organic matter.)

In lieu of natural soils, manmade soils consisting of loam with equal volumes of organic and mineral materials can be used. In this regard, clean leaf compost or other soil amendment(s) may be used to meet the requisite organic carbon/organic matter content noted above.

It is expected, however, that the General Contractor's Wetland Scientist will make adjustments to the above-referenced site preparation guidelines if determined to be warranted based upon site-specific subsurface, hydrologic and/or other relevant conditions observed during site preparation. In the event changes to the site preparation are determined to be warranted, the SCC or its agent will be notified. Any such changes only will be implemented following approval by the SCC or its agent.

Replication Site Planting

The application of the seed mix, as referenced below, will be conducted in accordance with procedures provided by the nursery supplying the seed mix. Additionally, the seed will be furnished and delivered in new, clean, sealed, and properly labeled containers. All seed will comply with State and Federal seed laws. Seed which has become wet, moldy or otherwise damaged shall not be acceptable.

Re-vegetation of the wetland replication area will include the mechanical application or application via hydro-seeding of the seed mix specified in Tables 3-1, below. New England Roadside Matrix Wet Meadow Seed Mix (or equivalent) will be applied to each wetland replication area to establish a mixture of both woody and herbaceous vegetation. If applied via hydro-seeding, the hydro-seed mixture will contain a green dye to allow for easy visual metering during application, and shall be nontoxic to plant life or animal life. The seed mix will be applied at a rate of 1 lb/1,245 square feet or as specified otherwise by the nursery supplying the seed mix.

As with the establishment of final replication site grades/elevations, it is anticipated that the planting plan will be adjusted by the Wetland Scientist if determined to be warranted based upon site-specific subsurface, hydrologic and/or other relevant conditions observed during site preparation. In the event changes to the planting plan are

TO: Lamoureux Pagano Associates, Nitsch Project # 7683
Date: December 1, 2009
Page 3 of 5

determined to be warranted, the SCC or its agent will be notified. The adjusted/revised planting plan will not be implemented until approved by the SCC or its agent.

Upon completion of seed mix application, each wetland replication area will be covered with a 100% biodegradable (e.g. straw/coconut fiber) erosion control blanket with 100% biodegradable netting. The erosion control blanket will be installed in accordance with the manufacturer's/distributor's specifications. Following installation of the erosion control blanket, the wetland replication areas will be watered as directed by the Wetland Scientist, with watering to continue at the direction of the Wetland Scientist. Water to the site, including hose and all other watering equipment required for the work, is expected to be furnished by the Contractor and be suitable for irrigation and free from ingredients harmful to plant life.

All plantings will occur either following snow-melt in the spring, but no later than April 30th. It is anticipated that the Wetland Scientist will verify this planting schedule with the nursery supplying the seed mix prior to seed mix application.

New England Roadside Matrix Mix (or equivalent)

The New England Roadside Matrix Mixes are designed for use along roads and highways. These mixes are unusual in that they blend native grasses, wildflowers and shrubs together in a native matrix seed mix. In areas that receive frequent mowing, such as those closest to the roadway shoulder, the warm season grasses will dominate. In areas farther from the road that may be mown only once each year, or in hard to mow areas such as around sign posts, the wildflower component will become dominant. Along cuts and side slopes that may never be mown, the shrub component will add diversity, beauty, and wildlife habitat to the roadside plantings. These are particularly appropriate seed mixes for roadsides, industrial sites, or cut and fill slopes.

Seeding: These mixes may be applied by hydro seeding or by mechanical spreader. When applying on bare soil, rake the soil to create a slightly rough surface, apply seed, then gently rake over. Best results are obtained with a Spring or Summer seeding. Summer seeding will be successful with a light mulching of weed free straw to conserve moisture. These mixes are not well suited to late Fall or Winter dormant seeding.

New England Roadside Matrix Wet Meadow Seed Mix

Species: GRASSES: Switch Grass (*Panicum virgatum*), Creeping Red Fescue (*Festuca rubra*), Virginia Wild Rye (*Elymus virginicus*) WILDFLOWERS: Nodding Bur-marigold (*Bidens cernua*), Blue Vervain (*Verbena hastata*), Flat-top Aster (*Aster umbellatus*), Spotted Joe Pye Weed (*Eupatorium maculatum*), Boneset (*Eupatorium perfoliatum*) SHRUBS: Arrowwood (*Viburnum dentatum*), Silky Dogwood (*Cornus amomum*), Nannyberry (*Viburnum lentago*)

Application Rate: 35 LBS/ACRE (1245 SQ. FT/LB.)

Source: New England Wetlands Plants, Inc. (2007)

Monitoring and Maintenance Plan

Wetland replication site monitoring will include supervision of all wetland replication activities, including but not limited to the installation of soil erosion and sedimentation controls, excavation of wetland replication areas, soils introduction and grading, and re-vegetation of the replication areas. Monitoring will be conducted by a qualified Wetland Scientist, anticipated to be retained by the Contractor.

Unless specified otherwise in the Order of Conditions, the Wetland Scientist will monitor the above-referenced activities throughout the wetland replication area construction effort. Following wetland replication area construction,

TO: Lamoureux Pagano Associates, Nitsch Project # 7683
Date: December 1, 2009
Page 4 of 5

the Wetland Scientist shall monitor the replication area at least twice annually for a minimum of three (3) growing seasons (on or about June 1st and September 15th), or until a Certificate of Compliance is issued by the SCC. During this monitoring period, annual monitoring reports will be prepared and filed with the SCC, as described below.

Prior to replication area construction, photographs will be taken to document existing site conditions. Photographs also will be taken during and after each phase of site preparation and planting. Each photograph will note the date, time, weather, and other relevant observations.

As noted above, the Wetland Scientist shall monitor the replication area at least twice annually for a minimum of three (3) growing seasons (on or about June 1st and September 15th) following wetland replication area construction, or until a Certificate of Compliance is issued by the SCC. During each monitoring event, the Wetland Scientist will record baseline data within each replication area. These data will consist of plant species composition and percent cover, based upon direct observations and visual estimates. Photographs of the wetland replication area also will be taken coincident with each monitoring event. Each photograph will note the date, time, weather, and other relevant observations.

Additionally, general observations will be made during each monitoring event relative to the integrity of erosion/sedimentation controls, the establishment of vegetation, side-slope stabilization, and factors/events adversely affecting the viability of the wetland replication area. These factors/events may include herbivory or invasion by such species as common reed (*Phragmites australis*). In this regard, it is important to note that, due to the existing presence of *Phragmites* and its naturally aggressive growth habit, the elimination of this plant species from the replication areas may not be either feasible or practicable.

Regardless, in the event invasive plant species are observed in the replication area(s) and if corrective action is deemed warranted, the Wetland Scientist will coordinate with the SCC to determine the most appropriate course of action, if any, prior to implementation of any remedial actions/controls. The Wetland Scientist will take similar coordination actions in the event that indigenous wetland plant species have not become established over at least 75% of the surface of the replication area following the second growing season.

For the duration of the monitoring period, monitoring reports will be prepared annually and provided to the SCC. In addition to summaries of annual monitoring events, the monitoring reports will address the following:

- Consultations with the SCC or its agent relative to the wetland replication areas
- Remedial actions/controls conducted during the monitoring year, including those conducted to improve the success potential of the wetland replication program.
- Recommendations for future remedial activities
- Monitoring Report Appendices, including:
 - An 'as-built' grading plan showing plant existing and replicated plant communities by vegetative type
 - A list of volunteer plant species in each plant replication area by community type
 - Representative photographs of the replication areas taken from the same location for each monitoring event, and map(s) indicating the locations of photographic stations

The first annual report will be prepared at the end of the first growing season following implementation of the wetland replication plan. The monitoring reports will be submitted to the SCC no later than December 15th following each growing season, and will reference the project name and location, the monitoring report number (e.g. Monitoring Report 1 of 3) and relevant permit/file number(s).

Date: December 1, 2009
Page 5 of 5

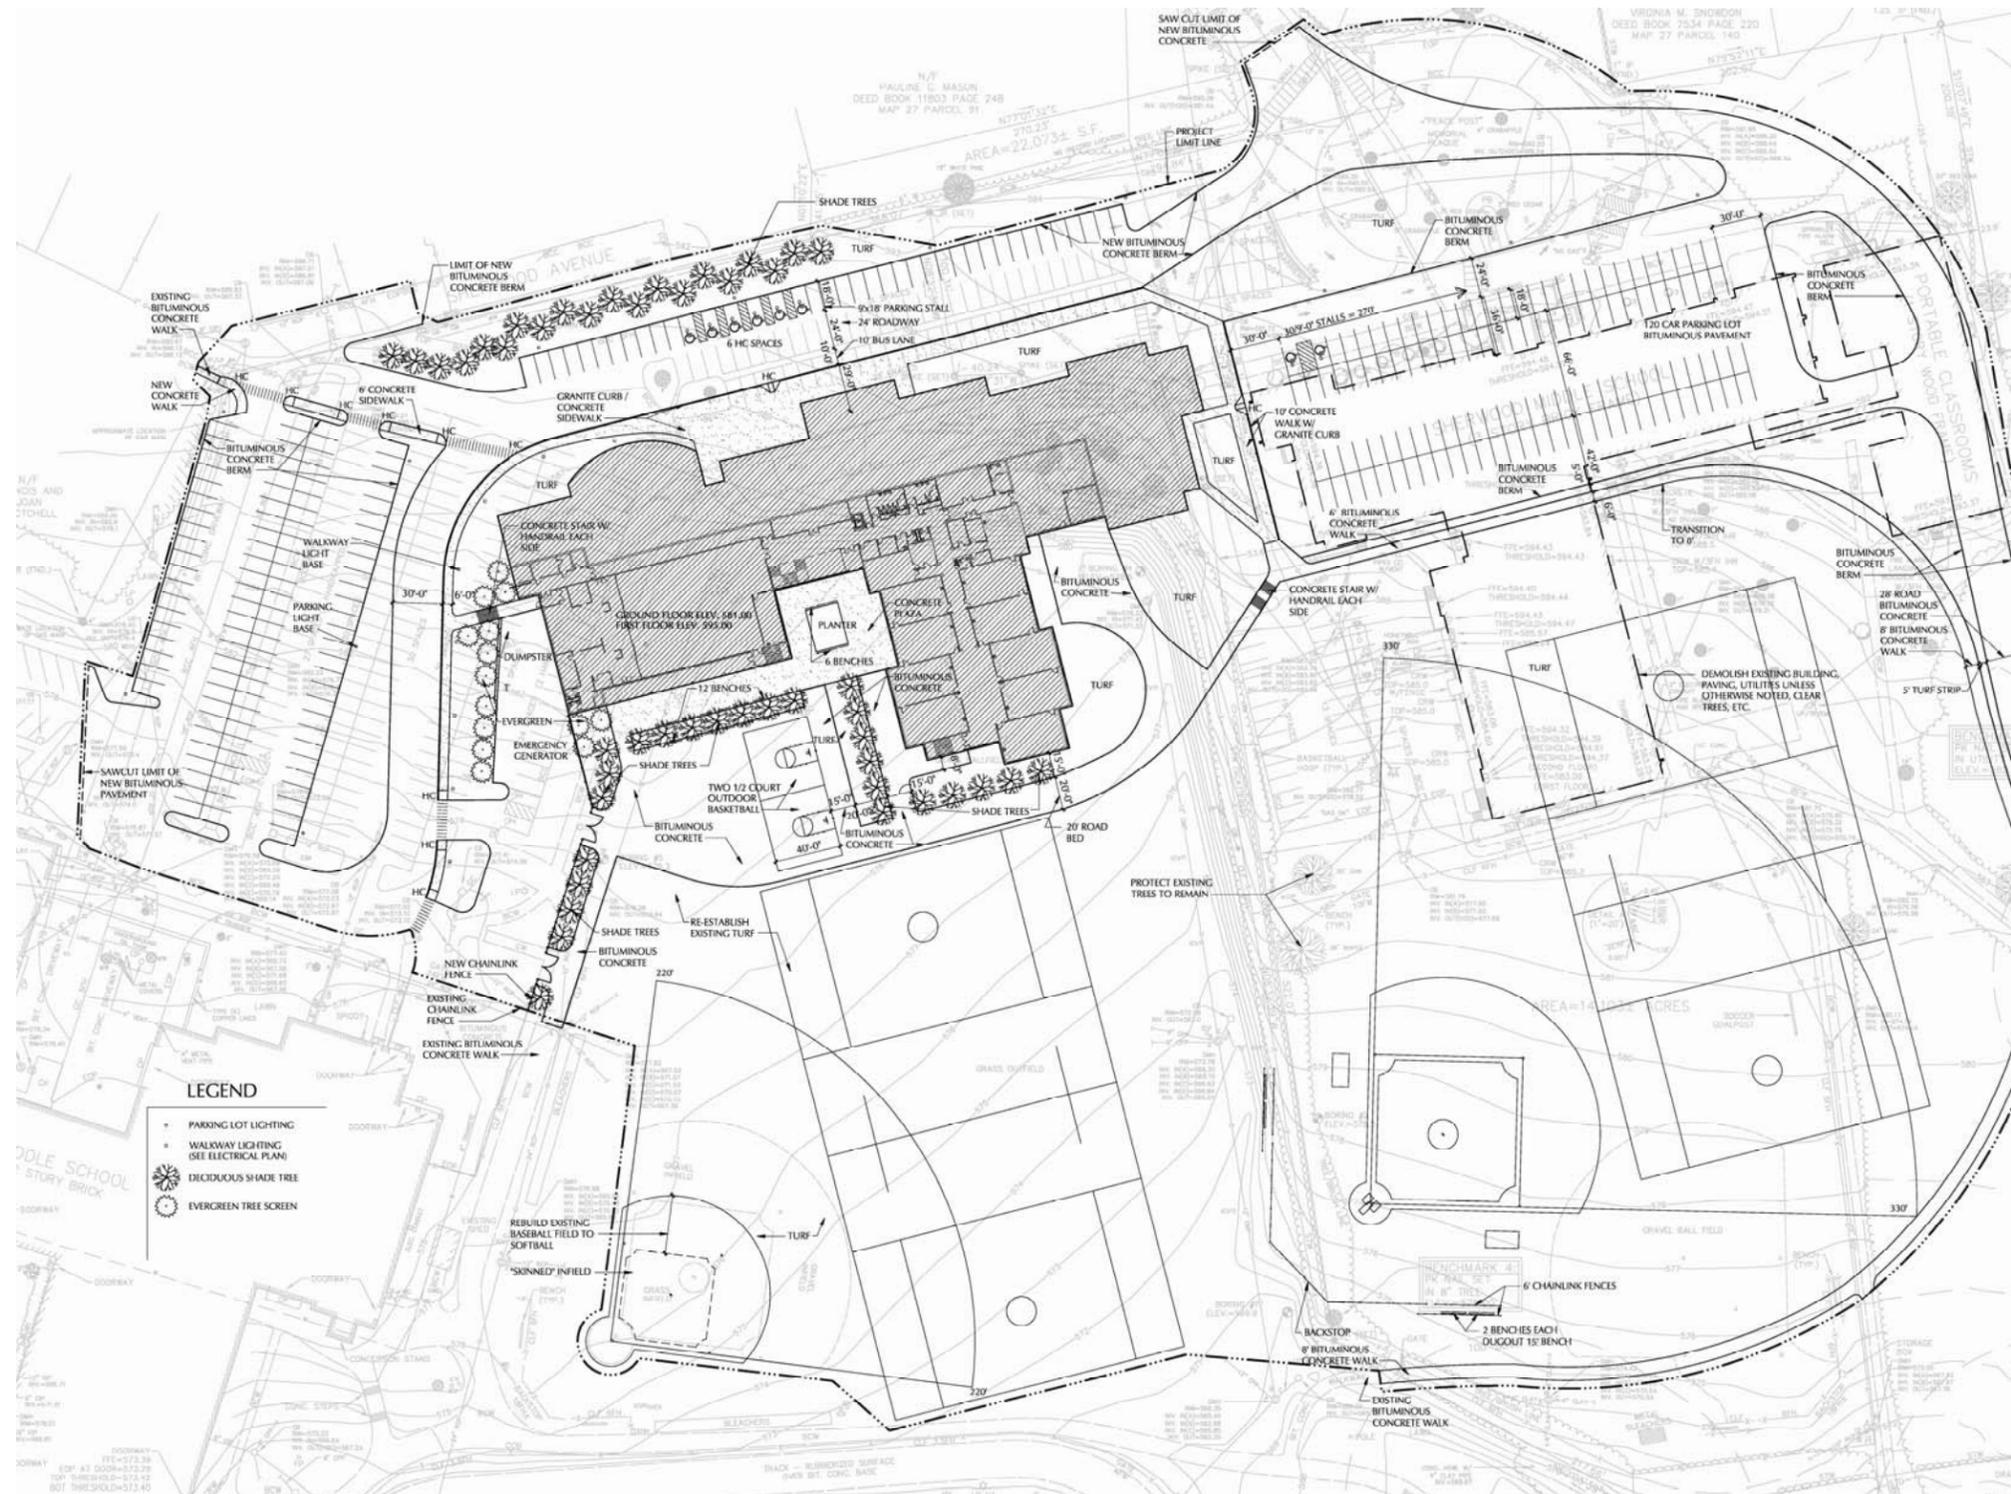

STORM DRAINAGE SYSTEM:

The storm drainage system being proposed for this project is a closed system consisting of underground plastic piping, deep sump hooded catch basins, water quality structures and an underground detention/infiltration system (large diameter perforated pipe wrapped in stone and geotextile fabric) as detailed on sheet C203 of the schematic design documents dated 11/17/09.

PERMITTING REQUIREMENTS

Since this project will disturb more than one acre of land, a National Pollutant Discharge Elimination System (NPDES) Stormwater Construction General Permit also will be required. To apply for coverage under this General Permit, a Notice of Intent will be submitted to the U.S. Environmental Protection Agency prior to the commencement of construction. This Notice of Intent requires the development and implementation of a Stormwater Pollution Prevention Plan (SWPPP) for construction activities. The SWPPP is a detailed erosion and sediment control plan that indicates the structural and non-structural erosion and sediment controls that will be employed, as appropriate, to control erosion on the construction sites. These measures will include such items as temporary seeding, mulching, silt fences, check dams and storm drain inlet protection. The SWPPP also will include provisions that these erosion control measures be inspected regularly to ensure that they are functioning properly.

The project is proposing to permanently alter areas of Bordering vegetated Wetlands (BVW) and do work within the 100-foot buffer zone of the BVW located on-site. This will require the filing of a Notice of Intent (NOI) with the Shrewsbury Conservation Commission and the issuance of an Order of Conditions.

**RE: Phase I Environmental Site Assessment
28 Sherwood Avenue
Shrewsbury, Massachusetts**

Dear Mr. Dieb:

Lord Associates, Inc. has completed a Phase I Environmental Site Assessment of the referenced property ("Site"). Environmental investigations were completed with consideration to standard industry practice, the ASTM E-1527 site assessment standard entitled "Environmental Site Assessments for Commercial Real Estate", applicable regulations as defined by Chapter 21E of the Massachusetts General Laws, and the Massachusetts Contingency Plan (MCP, 310 CMR 40.0000). The purpose of this assessment was to identify "Recognized Environmental Conditions" as defined in ASTM E-1527-05, and to determine if additional investigation is warranted. A summary of conclusions and recommendations is presented below.

Through the course of this Phase I Environmental Site Assessment, no Recognized Environmental Conditions were identified at the Site. Two conditions of concern were identified. In 1993, a single 10,000-gallon underground fuel oil storage tank (UST) was removed from the west side of the building in 1993; no soil testing results were made available through records reviewed in this assessment. In order to determine whether a release has occurred in the area of this former UST, soil testing would have to be performed. Secondly, based on the age of the building, it is possible that PCBs may be present in light fixtures and caulking.

We appreciate the opportunity to have provided our professional environmental consulting and analytical services.

Sincerely,
LORD ASSOCIATES, INC.

Ralph Tella, CHMM, LSP

APPENDIX A – FIGURES AND PHOTOGRAPHS

APPENDIX B – FIRSTSEARCH REPORT

APPENDIX C – MUNICIPAL & MADEP INFORMATION

1.0 INTRODUCTION

1.1 Purpose

Lord Associates, Inc. (LAI) has completed a Phase I Environmental Site Assessment for 28 Sherwood Avenue in Shrewsbury, Massachusetts. The purpose of this assessment was to identify “Recognized Environmental Conditions” as defined in ASTM standard E1527-05, and to determine if additional investigation is warranted.

Recognized Environmental Conditions are defined as the presence or likely presence of any hazardous substances or petroleum products on the property under conditions that indicate an existing release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term Recognized Environmental Conditions is not intended to include *de minimis* conditions which generally do not present a material risk of harm to public health or the environment, and that generally would not be the subject of a notification and/or enforcement action if brought to the attention of appropriate governmental agencies.

The Phase I consisted of a Site reconnaissance, and an assessment of the Site and surrounding properties for visual and/or olfactory evidence of the use, storage, and/or release of oil and/or hazardous material. The Phase I also included a review of federal, state, and local agency files regarding the history of the Site and surrounding area relative to the use, storage and/or release of oil and/or hazardous material.

Please note that an investigation for the presence of lead based paint or asbestos is beyond the scope of work described by ASTM E1527-05, therefore LAI did not explore those conditions.

1.2 Project Scope

This assessment was performed following standard industry practice and with consideration to the ASTM E-1527 site assessment standard entitled “Environmental Site Assessments for Commercial Real Estate.” Limitations to this practice are described in Lord Associates, Inc.’s proposal and **Section 6.0** of this report. The investigation included completion of the following tasks:

1. A field investigation was performed including a visual surficial inspection of the Site and abutting properties; and
2. The following agencies were contacted to inquire of past ownership, complaints, or violations concerning environmental issues at the Site and vicinity.
 - The Massachusetts Department of Environmental Protection (MADEP)
 - The Shrewsbury Tax Assessor’s Office

The Site is located in an Area of Critical Environmental Concern (ACEC) defined as protected open space. Two additional ACECs are located within ½-mile of the Site, both of which are protected open spaces, located approximately 0.15 miles to the northeast and approximately 0.20 to the northwest of the Site.

2.3 Hydrogeology

According to the United States Geological Survey (USGS) Marlborough Quadrangle Topographical Map, the elevation of the Site is approximately 594 feet above mean sea level. Topography of the Site vicinity is flat with a slight slope to the south. The direction of groundwater flow in the vicinity is assumed to the south.

No water bodies are located on the Site. No local water bodies are located within a half-mile of the Site.

According to the Bureau of Waste Site Cleanup Priority Resources Maps published by the MADEP, the Site is not located within a current or potential drinking water source area.

2.4 Site Description and Usage

The Site is approximately 14.2 acres of land located on the south side of Sherwood Avenue in Shrewsbury, Massachusetts. One two-story school building occupies the northern portion of the Site. The Site building is surrounded by asphalt paved driveways and parking areas to the north. Basketball courts exist to the west, and sports fields to the south. Wooded land exists to the east. The Site is used as a middle school, grades 5 and 6. A detailed Site description is presented in **Section 3.0**.

2.5 Environmental Liens

There was no information reported over the course of this investigation by “users” with respect to environmental liens pertaining to the Site. Users are defined by ASTM as “the party seeking to use Practice E 1527 in the environmental site assessment process.”

2.6 Site History

Research regarding historical land usage of the Site and surrounding properties was conducted using data obtained from parties familiar with the Site, and municipal officials. Based on information gathered through the course of this assessment, the following history of the Site has been prepared:

During an interview, Mr. Robert Cox, Superintendent of Shrewsbury Public Buildings, indicated that the school was constructed in 1964 and used as the Shrewsbury Junior High School. Reviews of 1941 and 1953 historical topographical maps of the Worcester Quadrant indicate that the Site was previously undeveloped land.

3.0 SITE INSPECTION

On September 14, 2009, LAI personnel conducted on-Site inspections, which consisted of a visual examination of the Site and portions of adjacent properties and interviews with Site personnel. Areas were examined for surficial indications of releases of OHM.

Mr. Robert Cox accompanied our personnel during the inspection. A Site Plan depicting significant features observed is included as **Figure 3** and photographs are included in **Appendix A** of this report.

3.1 Interior Inspection

One two-story school building with basement is located on the Site. It is constructed with brick, steel and concrete foundation. It is currently occupied by Sherwood Middle School, and houses the 5th and 6th grades. According to Mr. Cox, the main building was constructed in 1964 and is connected to municipal water, sewer and electric. In 1995, 11 modular classrooms were added on to the eastern side of the original building and are also connected to municipal water, sewer and electric.

The main building occupies two-stories and an area of approximately 89,957 square feet. Most of the classrooms are comprised of 12" x 12" vinyl floor tile, plaster ceiling and ceramic tiled and acoustic tiled walls. The corridors and stairwells are comprised of 12" x 12" vinyl floor tile, plaster ceilings and brick walls. The main building is heated using fuel-oil-fired forced hot air. A 9,500-gallon underground fuel storage tank (UST) is located in the western exterior portion of the Site.

A kitchen area exists on the western side of the building. Floor drains and a grease trap were observed in this area. Mr. Cox indicated that the all of the floor drains in the building are connected to the municipal sewer system. The grease trap is cleaned twice a year and is connected to the sewer system. Two sets of Boys and Girls restrooms exist off the main corridor on each floor. Floor drains were observed in the restrooms. A hydraulic elevator exists on the southern side of the building. The elevator was installed in 1993 and routine maintenance is performed on the elevator four times a year. No evidence of significant staining or a release was observed in the vicinity of the hydraulic reservoir. Three high voltage transformers are located in a first floor electrical room; LAI was not able to gain access to the room. However, Mr. Cox indicated that the old transformers were removed approximately three years ago by the electric company as part of routine upgrades to remove any PCB containing equipment.

PCBs can be found in hydraulic-oil filled electrical equipment (such as motors and pumps), capacitors or transformers, and fluorescent light ballasts manufactured prior to July 2, 1979. LAI observed fluorescent light fixtures throughout the Site. Age of the fixtures could not be determined. However, it is not likely that they are thirty years old and still working. Additionally, any light ballast manufactured after 1979 must be labeled "No PCB". Note that electric light ballasts that contained PCBs had less than 1.5 ounces of PCB. The reportable quantity requiring notification to the Massachusetts Department of Environmental Protection of a release is one pound. Therefore the risk presented by PCB-containing ballasts is relatively low.

A garage area with bay door is located on the western side of the building. The room contains yard maintenance equipment, a fire resistant cabinet containing extra gasoline, and small containers of maintenance supplies, three 5-gallon buckets of fuel additive, one 55-gallon drum without a label, and one 55-gallon drum of solvent cleaner for the boiler.

The two boilers and hot water tank is located adjacent to the garage maintenance area. The pilots for the two boilers are light by natural gas. A sump is located in the boiler room and according to Mr. Cox is connected to the sewer system. A generator was observed in one of the maintenance rooms, it is fueled with diesel oil contained in a belly aboveground storage tank (AST) with a secondary containment system. Lord Associates, Inc. personnel did not observe any evidence of on-Site releases of OHM.

The modular classrooms occupy an area of approximately 11,836 square feet, and are constructed on concrete pillars. The modular classrooms are heated using natural gas-fired forced hot air. LAI personnel did not inspect the roof.

3.2 Exterior Inspection

The Site consists of approximately 14.2 acres. Automobiles were parked on the asphalt surface located on the northern side of the Site. Basketball courts exist on the western side of the Site and sports fields to the south. Wooded land exists to the east. One 9,500-gallon underground fuel storage tank (UST) is located in the western side of the Site, under the basketball courts. An out-of-use sawdust collector was observed on the exterior portion of the western side of the building.

No evidence of a significant surface release of oil or hazardous material was observed through the course of our inspection.

3.3 Oil or Hazardous Materials

OHM observed on the Site during the inspections consisted of the following:

- Container of gasoline
- Three 5-gallon buckets of fuel additive
- One 55-gallon drum without a label
- One 55-gallon drum of solvent cleaner for the boiler
- One 250-gallon diesel AST associated with the generator

3.4 Underground Fuel Storage Tanks (USTs)

One 9,500-gallon underground fuel storage tank (UST) was installed in 1993 and is located in the western exterior portion of the Site, under the basketball courts. A Fire Department Permit for the removal of one 10,000-gallon UST was dated October 13, 1993. No records of soil testing were available in files reviewed. According to Mr. Cox the 9,500-gallon UST was installed in the tank grave of the 10,000-gallon UST.

3.5 Indications of Polychlorinated Biphenyls (PCBs)

Lighting fixtures located throughout the building may contain polychlorinated biphenyls (PCBs) in their electric ballasts. Based on the age of the building (1964), it is also possible that caulking may contain PCBs.

3.6 Solid Waste Disposal

Two solid waste dumpsters were observed at the Site. No evidence of a release of OHM was observed in the area of the dumpster.

3.7 Previous Environmental Investigations

According to Mr. Cox, previous environmental investigations have not been completed at the Site.

An asbestos abatement project began in 1989, asbestos and air quality monitoring has been completed annually since that time.

3.8 Surrounding Lot Features

Residential properties surround the Site to the north, south and east. A school is located to the west. No bulk fuel storage was observed on adjacent properties.

4.0 RECORDS REVIEWS

A review of federal, state and local regulatory agency files was conducted in accordance with ASTM E-1527-05 standards to identify the use, generation, storage, treatment, disposal and/or release of oil and/or hazardous materials that may potentially impact the Site.

4.1 Municipal Offices

4.1.1 Assessors Office

Lord Associates, Inc. visited the municipal Assessor’s Office to review historical ownership information for the Site. This data was reviewed for the purposes of land use determination and should not be relied upon as a complete chain of title. The field card indicates that the Site is zoned “Res B-1, residential.” **Table 3** is a summary of ownership information obtained at the assessor’s office for the Site.

Table 2
Chain of Title

Grantee	Date of Acquisition	Book/Page
Town of Shrewsbury	12/13/1962	4338/283

LAI reviewed records with the Worcester County Registry of Deeds for the Site, which date back to 1978. No additional records were available for the Site.

4.1.2 Health Department

Lord Associates, Inc. made inquiries at the municipal Health Department. No records were available regarding the Site.

4.1.3 Building Department

A review of files was requested at the municipal Building Department to obtain information on historical building alterations. The following building permits were reviewed:

- Elevator Installation, dated August 18, 1993
- Addition of modular classrooms, dated July 14, 1995
- Temporary trailers, dated October 18, 2001
- Removal and replacement of siding, repair the roof of corridor connecting the modular classrooms, dated October 30, 2003
- Interior renovation, dated June 23, 2004

Flood Insurance Rate Maps (FIRM) was also available for review at the building department. According to the map on file dated June 4, 1980, the Site is located within an area designated as Zone C, indicating an area of minimal flooding.

4.1.4 Water Department

Personnel at the municipal Water Department reported that the Site was connected to the public water supply in 1964.

4.1.5 Conservation Commission

A review of files was requested at the Conservation Commission regarding environmental violations. No records were available regarding the Site.

4.1.6 Fire Prevention

Lord Associates, Inc. requested a review of information regarding the storage of hazardous materials at the Site from the municipal Fire Prevention Office. The Fire Prevention Office had a permit on file dated October 13, 1993, for the removal of a 10,000-gallon heating oil UST. No records of soil testing were available in files reviewed.

4.1.7 Public Library

A request was made at the municipal Public Library for historical town directories. No historical town directories were available.

4.2 Sanborn Map Review

Sanborn Fire Insurance Maps were reviewed for the Site and vicinity. Sanborn Maps usually show property use and underground commercial fuel storage for the purposes of insurance companies. Maps were not available for the Site.

4.3 Radius Search for Properties of Environmental Concern

A radius search was conducted of federal and state-listed sites of potential environmental concern as outlined in ASTM E-1527 guidelines. The search was performed using software developed by First Search Technology Corporation. Sites identified within the designated ASTM search radii are summarized in the following table. The FirstSearch report is included in **Appendix B**.

Table 5
Properties of Potential Environmental Concern

NPL (1 mi.)	RCRIS TSDF (1 mi.)	CERCLIS (0.5 mi.)	Landfill (0.5 mi.)	STATE SITES (0.5 mi.)	SPIILLS (0.25 mile)	ERNS (Site/ Abutters)	RCRIS (Site/ Abutters)	UST (Site/ Abutters)
NI	NI	NI	NI	Residence 15 Dawson Cir 2-10970/RAO 0.29-mile SE Elev. Diff: = -55 Sheperd Residence 59 Janet Cir 2-16118/RAO 0.45 mile SE Elev. Diff: = -19	NI	NI	NI	NI

Notes:

All above locations are in Shrewsbury, Massachusetts
 N=north, S=south, W=west, E=east
 Elev. Diff: = Difference in elevation from Site
 NPL = National Priorities List
 RCRIS = Resource Conservation and Recovery Information System
 TSDF = Treatment Storage & Disposal Facilities
 ERNS = Environmental Response Notification System
 NI = None Identified
 RAO = Closed in accordance with MADEP Regulations
 TierII = Listed with MADEP due to oil or hazardous material in soil/groundwater (not closed)
 DPS = Downgradient Property Status (contamination is from an upgradient source)
 UST = Underground Storage Tank

4.4 Massachusetts Department of Environmental Protection Review

Site-specific files were not reviewed at the Massachusetts Department of Environmental Protection (MADEP) since sites identified in the FirstSearch report have been closed out by the MADEP or the identified properties are located topographically and/or hydraulically downgradient from the Site. The identified properties, therefore, are not suspected to pose significant environmental threat to the Site.

5.0 RESTRICTIVE CONDITIONS

5.1 Limitations & Deviations

LAI did not identify any limitations or deviations during the Phase I Environmental Site Assessment that would affect the ability to identify conditions indicative of a release or threatened release or Recognized Environmental Conditions.

5.2 Significance of Data Gaps

LAI did not identify any data gaps during the course of the Phase I Environmental Site Assessment that would affect the ability to identify conditions indicative of a release or threatened release or Recognized Environmental Conditions (RECs).

6.0 SUMMARY OF FINDINGS AND CONCLUSION

Lord Associates, Inc. has completed a Phase I Environmental Site Assessment of the Site. This assessment was performed with consideration to standard industry practice and the ASTM E-1527 site assessment standard entitled "Environmental Site Assessments for Commercial Real Estate". Our findings are presented below:

1. Information provided indicates that the Site consists of a single lot totaling approximately 14.2 acres of land located south of Sherwood Avenue in Shrewsbury, Massachusetts. The Site is designated as Lot 93 on Shrewsbury Tax Assessor's Map 27. One two-story school building occupies the northern portion of the Site. The Site building is surrounded by asphalt paved driveways and parking areas to the north. Basketball courts exist to the west, and sports fields to the south. Wooded land exists to the east. The Site is used as a middle school, grades 5 and 6.
2. During an interview, Mr. Robert Cox, Superintendent of Shrewsbury Public Buildings, indicated that the school was constructed in 1964 and used as the Shrewsbury Junior High School. Reviews of 1941 and 1953 historical topographical maps of the Worcester Quadrant indicate that the Site was previously undeveloped land.
3. The Site is located in an Area of Critical Environmental Concern (ACEC) defined as protected open space. Two additional ACECs are located within ½-mile of the Site, both of which are protected open spaces, located approximately 0.15 miles to the northeast and approximately 0.20 to the northwest of the Site.
4. Lord Associates, Inc. conducted an inspection of the Site consisting of a visual examination of the Site, immediate surrounding features, and abutting properties. The building is connected to municipal water, sewer and overhead electric. Hanging fluorescent lighting fixtures were observed throughout the building. Although unlikely, given the age of the building, these fixtures may contain polychlorinated biphenyls (PCBs) in their ballasts. Similarly, given the age of the building, PCBs may be present in caulking.
5. Municipal file reviews were performed, which did not indicate that releases of oil and/or hazardous materials (OHM) have occurred at the Site. One 9,500-gallon underground fuel storage tank (UST) was installed in 1993 and is located in the western exterior portion of the Site, under the basketball courts. A Fire Department

Permit for the removal of one 10,000-gallon UST was dated October 13, 1993. No records of soil testing were available in files reviewed. According to Mr. Cox, the 9,500-gallon UST was installed in the tank grave of the 10,000-gallon UST.

6. Two state-listed properties were identified in the radius search of waste sites in the vicinity. These properties were listed as closed, or due to their location, are hydrologically down gradient from the Site. Based on the location, distance, and/or cleanup activities, it is our opinion that these properties listed in the vicinity will not adversely impact the Site.

Conclusions

This assessment has not identified any Recognized Environmental Conditions in connection with the property, 28 Sherwood Avenue in Shrewsbury, Massachusetts. Two conditions of concern were identified: a 10,000-gallon fuel oil UST was removed from the west side of the building in 1993; no soil testing was made available through records reviewed in this assessment. In order to determine whether a release has occurred in the area of this former UST, soil testing would have to be performed.

Based on the age of the building, caulking and fluorescent light fixtures may contain PCBs.

Any exceptions to, or deletions from, ASTM Practice E1527 are described in **Section 5.0** of this report. Please note that an investigation for the presence of lead based paint or asbestos is beyond the scope of work described by ASTM E1527-05, therefore LAI did not explore those conditions.

7.0 ENVIRONMENTAL PROFESSIONAL STATEMENT

LAI declares that, to the best of our professional knowledge and belief, we meet the definition of *Environmental Professional* as defined in §312.10 of 40 CFR 312. LAI has the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. LAI has developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

8.0 LIMITATIONS

No warranty, whether expressed or implied, is given with respect to this report or any opinions expressed herein. It is expressly understood that this report and the opinions expressed herein are based upon Site conditions as they existed only at the time of assessment.

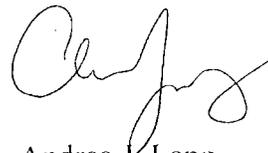

The data reported and the findings, observations, and opinions expressed in the report are limited by the Scope of Work. The Scope of Work was performed based on budgetary, time, and other constraints imposed by the Client, and the agencies and persons reviewed. In preparing this report, Lord Associates, Inc. has relied upon and presumed accurate certain information about the Site and adjacent properties provided by governmental agencies, the client and others identified in the report. Except as otherwise stated in the report, Lord Associates, Inc. has not attempted to verify the accuracy or completeness of any such information.

This report has been prepared on behalf of and for the exclusive use of Rockland Federal Credit Union and those immediate entities involved with the proximate financing of this project, solely for use in the environmental evaluation of the Site.

This report is dated this September 21, 2009 and is signed by individuals who are duly authorized to do so.

Notice of Disclaimer

Due to the limitations, constraints, inaccuracies and incompleteness of government information and computer mapping data currently available to FirstSearch Technology Corp, certain omissions have been noticed in preparing the locations of all federal, state and local agency sites resulting in FirstSearch Technology Corp's database. All EPA NPL and state landfill sites are depicted by a rectangle approximating their location and size. The boundaries of the rectangles represent the eastern and western most longitudes, the northern and southern most latitudes. As such, the mapped areas may exceed the actual area and do not represent the actual boundaries of these properties. All other sites are depicted by a point representing their approximate address location and make no attempt to represent the actual area of the associated property. Actual boundaries and locations of individual properties can be found in the files residing at the agency responsible for each information.

Waiver of Liability

Although FirstSearch Technology Corp uses its best efforts to research the actual location of each site, FirstSearch Technology Corp does not and can not warrant the accuracy of these sites with regard to their location and size. All authorized users of FirstSearch Technology Corp's services, including any qualifying an understanding of FirstSearch Technology Corp's searching and mapping conventions, and agree to waive any and all liability claims associated with search and map results showing incomplete and/or inaccurate site locations.

XI. CERTIFICATION OF COMPLIANCE (COMPLETE FOR ALL NEW AND UPGRADED TANKS AT THIS LOCATION)

Tank Identification Number	Tank No. <u>1</u>	Tank No. _____	Tank No. _____	Tank No. _____	Tank No. _____
1. Installation					
A. Installer certified by tank and piping manufacturers	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
B. Installer certified or licensed by the implementing agency	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
C. Installation inspected by a registered engineer	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
D. Installation inspected and approved by implementing agency	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
E. Manufacturer's installation check-lists have been completed	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
F. Another method allowed by State agency. Please specify.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

2. Release Detection (Mark all that apply)	TANK	PIPING	TANK	PIPING	TANK	PIPING	TANK	PIPING	TANK	PIPING
A. Manual tank gauging	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
B. Tank tightness testing	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
C. Inventory controls	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
D. Automatic tank gauging	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
E. Vapor monitoring	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
F. Groundwater monitoring	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
G. Interstitial monitoring double walled tank/piping	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
H. Interstitial monitoring/secondary containment	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
I. Automatic line leak detectors	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
J. Line tightness testing	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>							
K. Other method allowed by Implementing Agency. Please specify.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

3. Spill and Overfill Protection					
A. Overfill device installed	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
B. Spill device installed	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

OATH: I certify the information concerning installation that is provided in section X is true to the best of my belief and knowledge.

Mr. John J. Ostrosky, Chairman
Shrewsbury Conservation Commission
Town Hall, 100 Maple Avenue
Shrewsbury, Massachusetts 01545

Via: Hand Delivery

Reference: Abbreviated Notice of Resource Area Delineation
Sherwood Middle School
Shrewsbury, Massachusetts
WDA JN-135.05

Dear Mr. Ostrosky and Members of the Commission:

On behalf of The Town of Shrewsbury (Applicant), we are submitting herewith an Abbreviated Notice of Resource Area Delineation (ANRAD) for the confirmation of the resource areas only, namely areas of bordering vegetated wetlands. The resource areas to be reviewed are located generally on the south/southeast portion of the Sherwood Middle School property. No work is being proposed at this time. This filing has been prepared in accordance with the Massachusetts Wetlands Protection Act (Act) and the Town of Shrewsbury Wetlands Policy. As the Town is the Applicant, this filing qualifies as fee exempt.

We have enclosed the following for your reference:

1. WPA Form 4A, Abbreviated Notice of Resource Area Delineation for Resource Area Delineation Only
2. USGS Locus Map
3. Certified List of Abutters within 100 feet
4. Notification of Abutters
5. FEMA Flood Map (Community Panel # 250332 0003 B)
6. Existing Conditions Plans, prepared by WDA, Inc., dated July 21, 2009.

The 14± acre locus property (Property) has a total of approximately 446 feet of frontage along Crescent Street, although access to the school and Property is via a driveway off of Sherwood Avenue/Oak Street. The Property is located entirely within the Residential B Zoning District and the Property is bounded by the Oak Middle School to the west and by residential parcels to the north, east and south. No portion of the Property contains an area of Zone A, 100-year flood zone, as shown on the Flood Insurance Rate Map for the Town of Shrewsbury (Community Panel # 250332 0003 B, effective date June 4, 1980). The Property does not contain a designated area of priority habitat of rare species, wildlife or vernal pools, according to the Natural Heritage Atlas, valid from October 1, 2008.

An area of bordering vegetated wetland is located at the south/southeastern side of the Property, associated with several intermittent streams and drainage channels, as well as the area of the

former ice rink. The wetland areas were delineated by WDA July 16, 2009 with numbered blue flagging and have been survey located by WDA. The boundaries were determined upon review of the existing vegetation, soils and hydrologic conditions, as well as the topography and other visual indicators. Soils were reviewed utilizing a hand auger and Munsell color chart. In general, the wetland areas follow a fairly distinct boundary at the toe of slope or along the streams and channels, although they are separated by paved walkways, upland breaks and drainage infrastructure. Most areas may be classified as wooded/shrub swamps, consisting of red maple, elm, winterberry, spicebush, highbush blueberry, speckled alder, silky dogwood, soft rush, skunk cabbage, cinnamon fern, sensitive fern, sphagnum and jewelweed. The marsh area (former ice rink) is predominately cattail, tussock sedge, bluejoint, soft rush, wool grass, buttonbush, skunk cabbage, sensitive fern with a fringe of red maple, winterberry, arrowwood, and speckled alder. Generally the upland areas consist of oak, pine, black birch, witch hazel, poplar, blackberry, rose, black cherry, American hazelnut, Pennsylvania sedge, Canada mayflower and bittersweet.

The larger wetland area is delineated by flag series WF-1 through WF-14 and WF-40 through WF-58, and the second largest area, just to the south, is delineated by flag series WF-15 through WF-37. These two wetland series are located toward Crescent Street in the southeast portion of the property. A headwall/culvert discharges flows from Crescent Street into a manmade channel, which discharges into the former ice rink area (generally WF-3 to WF-12 and WF-50 to WF-54). Seasonal flows from this area then enter a channel adjacent to the walkway and flow southeasterly into a 12" culvert under the walkway, flowing to the south. Two other culverts from Crescent Street enter into this wetland and form into a single channel, which flows to the southwest, eventually entering a drain inlet at the end of the channel/wetland. From there flows remain within a closed drainage system and leave the Property. The wetlands within this system are delineated by flag series WF-15 to WF-37.

The final wetland area is a small pocket located approximately 210' east of the end of the track and field area. This wetland area is associated with drainage from the baseball field to the north and water that seeps and flows from the slope below the field, which flows to a low area before entering into a headwall/culvert and discharging near the southern Property boundary. This wetland area is delineated by flag serried WF-100 to WF-104.

To summarize, we are requesting confirmation of the delineated wetland boundaries. No work is proposed at this time, and this process is to confirm the resource areas only, to serve future planning and design purposes. We thank you in advance for your attention to the information provided and look forward to meeting with the Commission to discuss the enclosed ANRAD at the next available hearing.

Very truly yours,

WATERMAN DESIGN ASSOCIATES, INC.

Brian P. Waterman
Wetland Specialist

B. Area(s) Delineated

1. Bordering Vegetated Wetland (BVW) 2,050 +/-
Linear Feet of Boundary Delineated
2. Check all methods used to delineate the Bordering Vegetated Wetland (BVW) boundary:
 - a. MassDEP BVW Field Data Form (attached)
 - b. Other Methods for Determining the BVW boundary (attach documentation):
 1. 50% or more wetland indicator plants
 2. Saturated/inundated conditions exist
 3. Groundwater indicators
 4. Direct observation
 5. Hydric soil indicators
 6. Credible evidence of conditions prior to disturbance
3. Indicate any other resource area boundaries that are delineated:

a. Resource Area	b. Linear Feet Delineated
c. Resource Area	d. Linear Feet Delineated

C. Additional Information

Applicants must include the following plans with this Abbreviated Notice of Resource Area Delineation. See instructions for details. **Online Users:** Attach the Document Transaction Number (provided on your receipt page) for any of the following information you submit to the Department.

1. ANRAD (Delineation Plans only)
2. USGS or other map of the area (along with a narrative description, if necessary) containing sufficient information for the Conservation Commission and the Department to locate the site. (Electronic filers may omit this item.)
3. Plans identifying the boundaries of the Bordering Vegetated Wetlands (BVW) (and/or other resource areas, if applicable).
4. List the titles and final revision dates for all plans and other materials submitted with this Abbreviated Notice of Resource Area Delineation.

E. Signatures

I certify under the penalties of perjury that the foregoing Abbreviated Notice of Resource Area Delineation and accompanying plans, documents, and supporting data are true and complete to the best of my knowledge. I understand that the Conservation Commission will place notification of this Notice in a local newspaper at the expense of the applicant in accordance with the wetlands regulations, 310 CMR 10.05(5)(a).

I further certify under penalties of perjury that all abutters were notified of this application, pursuant to the requirements of M.G.L. c. 131, § 40. Notice must be made in writing by hand delivery or certified mail (return receipt requested) to all abutters within 100 feet of the property line of the project location.

I hereby grant permission, to the Agent or member of the Conservation Commission and the Department of Environmental Protection, to enter and inspect the area subject to this Notice at reasonable hours to evaluate the wetland resource boundaries subject to this Notice, and to require the submittal of any data deemed necessary by the Conservation Commission or Department for that evaluation.

I acknowledge that failure to comply with these certification requirements is grounds for the Conservation Commission or the Department to take enforcement action.

1. Signature of Applicant

9/29/2009

2. Date

3. Signature of Property Owner (if different)

4. Date

5. Signature of Representative (if any)

6. Date

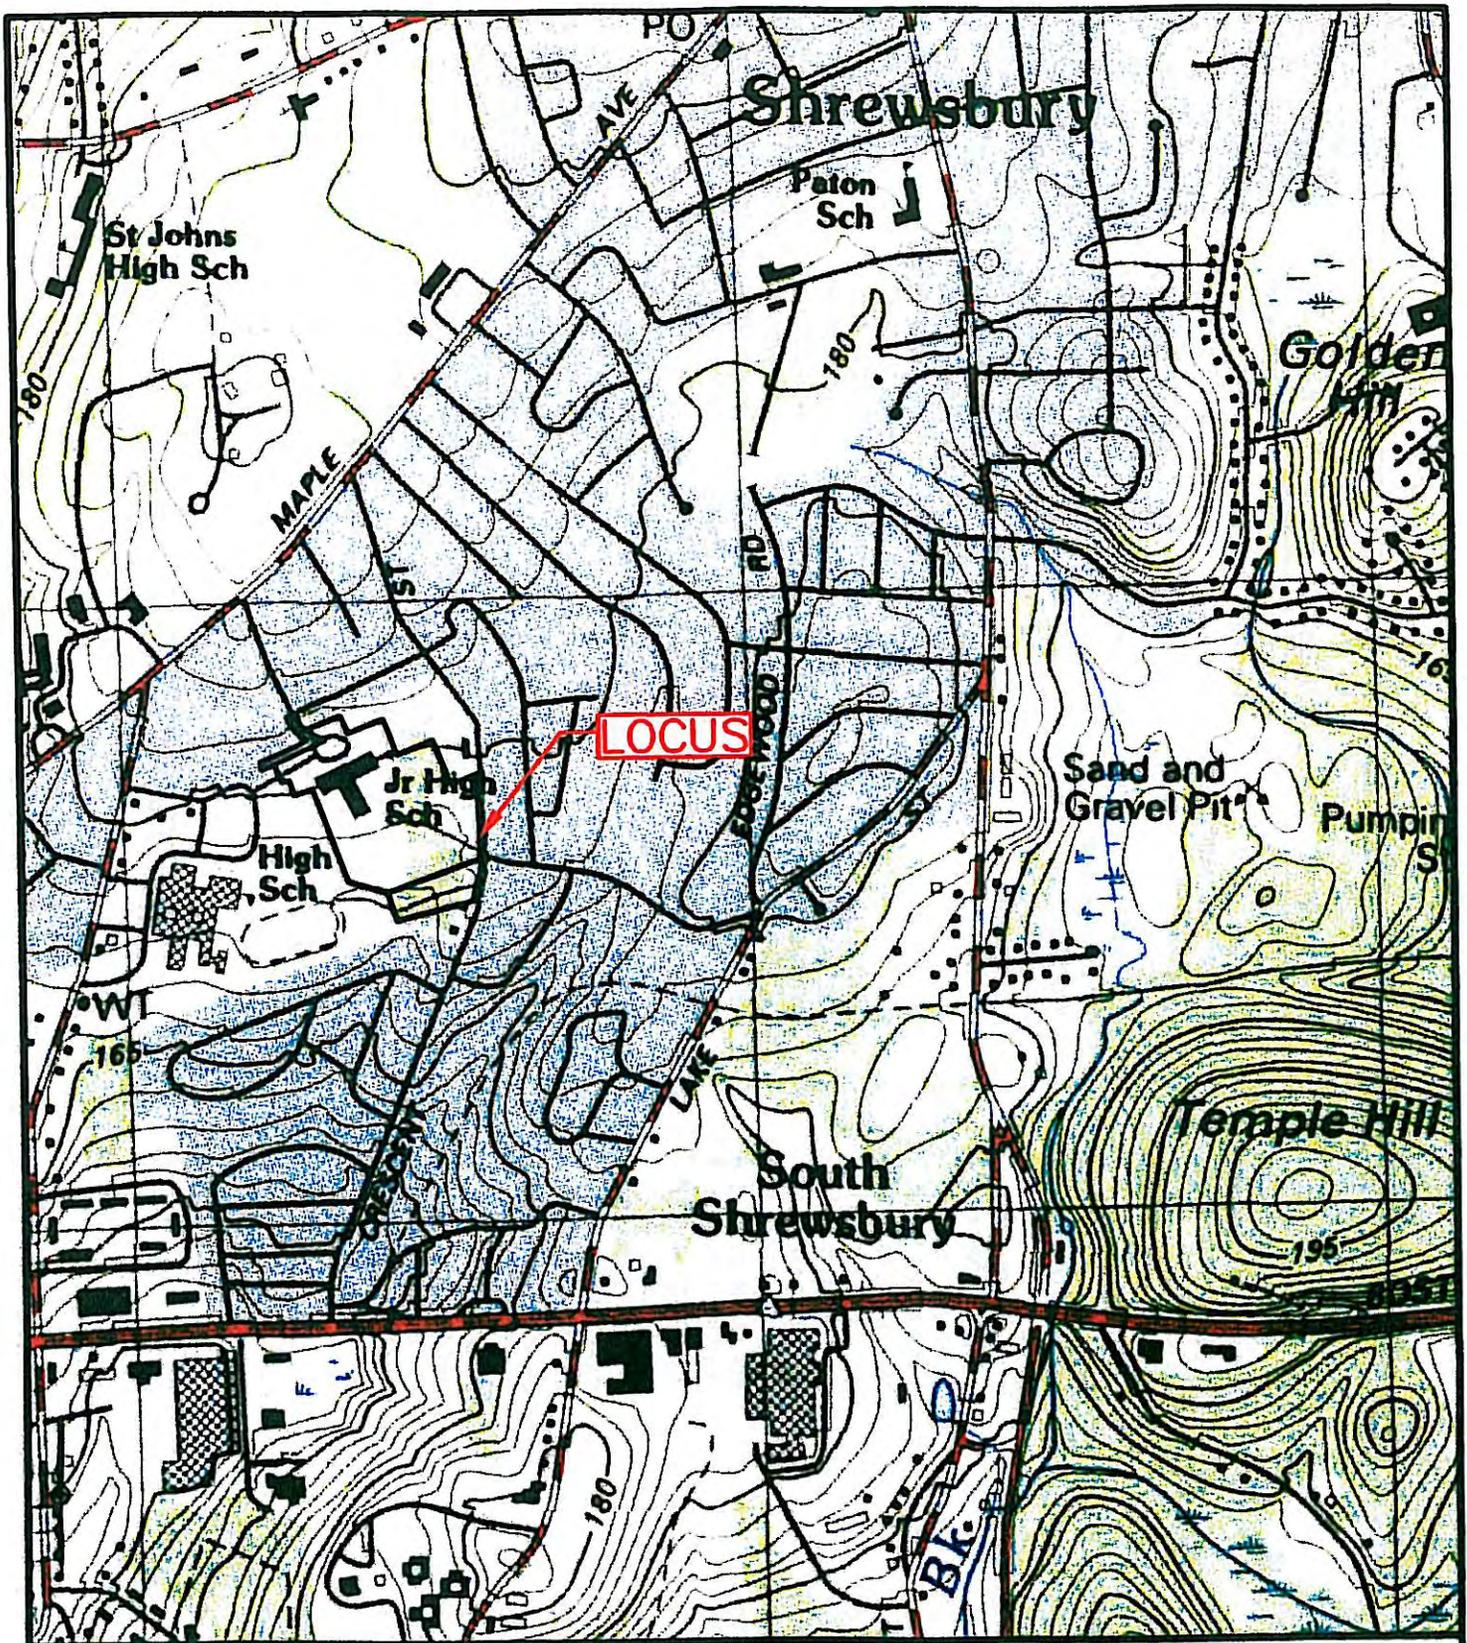

For Conservation Commission:

Two copies of the completed Abbreviated Notice of Resource Area Delineation (Form 4A), including supporting plans and documents; two copies of the ANRAD Wetland Fee Transmittal Form; and the city/town fee payment must be sent to the Conservation Commission by certified mail or hand delivery.

For MassDEP:

One copy of the completed Abbreviated Notice of Resource Area Delineation (Form 4A), including supporting plans and documents; one copy of the ANRAD Wetland Fee Transmittal Form; and a copy of the state fee payment must be sent to the MassDEP Regional Office (see Instructions) by certified mail or hand delivery. (E-filers may submit these electronically.)

The original and copies must be sent simultaneously. Failure by the applicant to send copies in a timely manner may result in dismissal of the Notice of Intent.

Christopher R. Reidy, Principal Assessor

Notification to Abutters Under the
Massachusetts Wetlands Protection Act

In accordance with the second paragraph of Massachusetts General Laws Chapter 131 Section 40, you are hereby notified of the following.

- A. The name of the applicant is: **Town of Shrewsbury**.
- B. The applicant has filed a Abbreviated Notice of Resource Area Delineation (ANRAD) with the Conservation Commission for the municipality of **Shrewsbury** seeking confirmation of wetland resource boundaries only, located on the Sherwood Middle School property located off of Sherwood Avenue and Crescent Street, per the requirements of the Wetlands Protection Act (General laws Chapter 131, Section 40).
- C. The address of the lot where the activity is proposed is:
28 Sherwood Avenue (assessors map 27/lot 93)
- D. Copies of the ANRAD may be examined at the **Shrewsbury Conservation Commission** between the hours of **8:00 AM - 4:00 PM** on the following days of the week: **Monday - Friday**
- For more information, call: **(508) 841-8502**
Check One: This is the applicant ____, representative ____, or other
X (specify): Conservation Commission.
- E. Copies of the ANRAD may be obtained from either (check one) the applicant ____, or the applicant's representative X, by calling this telephone number (508)366-6552 between the hours of 7:30 AM and 5:00 PM on the following days of the week: Monday through Friday.
- F. Information regarding the date, time and place of the public hearing may be obtained from the **Shrewsbury Conservation Commission** by calling this telephone number **(508)841-8502**.

Note: Notice of the public hearing, including its date, time, and place, will be published at least five (5) days in advance in the **Worcester Telegram & Gazette**.

Note: Notice of the public hearing, including its date, time, and place, will be posted in the City of Town hall not less than forty-eight (48) hours in advance.

Note: You also may contact your local Conservation Commission or the nearest Department of Environmental Protection Regional Office for more information about this application or the Wetlands Protection Act. To contact DEP, call:

Central Region: 508-792-7650

~~Seutheast Region: 508-946-2800~~

~~Northeast Region: 978-661-7600~~

~~Western Region: 413-784-1100~~

B. Order of Delineation

1. The Conservation Commission has determined the following (check whichever is applicable):

a. **Accurate:** The boundaries described on the referenced plan(s) above and in the Abbreviated Notice of Resource Area Delineation are accurately drawn for the following resource area(s):

1. Bordering Vegetated Wetlands
2. Other Resource Area(s), specifically:

b. **Modified:** The boundaries described on the plan(s) referenced above, as modified by the Conservation Commission from the plans contained in the Abbreviated Notice of Resource Area Delineation, are accurately drawn from the following resource area(s):

1. Bordering Vegetated Wetlands
2. Other Resource Area(s), specifically:

c. **Inaccurate:** The boundaries described on the referenced plan(s) and in the Abbreviated Notice of Resource Area Delineation were found to be inaccurate and cannot be confirmed for the following resource area(s):

1. Bordering Vegetated Wetlands
2. Other Resource Area(s), specifically:

3. The boundaries were determined to be inaccurate because:

C. Simplified Buffer Zone Review

Work within the Buffer Zone pursuant to the Simplified Review (310 CMR 10.02) requires that you must comply with the following conditions. If your project does not meet these requirements, you are required to either file a Determination of Applicability or Notice of Intent or take other corrective measures as directed by the Conservation Commission.

Simplified Review Conditions:

Work conducted under Simplified Review requires the following:

1. No work of any kind shall occur within any wetland resource areas including Riverfront Area and Bordering Land Subject to Flooding.
2. The inner 0-to-50-foot wide area from the delineated wetland boundary that has a Buffer Zone shall not be disturbed by any work associated with this project, including placement of any stormwater management components.
3. No work shall occur in the Buffer Zone bordering an Outstanding Resource Water (e.g., certified vernal pool, public water supply reservoir or tributary), as defined in 314 CMR 4.00 or border coastal resource areas at 310 CMR 10.25-10.35.
4. No work shall occur in the Buffer Zone adjacent to wetland resources with estimated wildlife habitat (which is identified on the most recent Estimated Habitat Map of State-listed Rare Wetlands Wildlife).
5. Erosion and Sedimentation controls shall be installed and maintained at the 50-foot Buffer Zone line or limit of work (whichever is a greater distance from the resource area) to protect resource areas during construction.
6. If the project is subject to the Massachusetts Stormwater Policy, all work shall be conducted in conformance with an approved Stormwater Management Plan.
7. The Buffer Zone does not contain a slope greater than an average of 15% at its steepest gradient across the 100-foot Buffer Zone.
8. The amount of new impervious surface, in combination with existing impervious surfaces, shall not exceed 40% of the Buffer Zone between 50 and 100 feet.
9. No work is allowed, and no additional NOI or RDA shall be filed, for any work within the 0-to-50-foot Buffer Zone during the three-year term of an Order associated with this application.
10. Prior to any work being undertaken pursuant to this Order, the wetland resource boundary shall be flagged; all boundary delineation flagging should be maintained for the term of the Order.
11. If stormwater management structures are proposed in the Buffer Zone, the stormwater management structures shall be maintained as required in the Stormwater Plan. Such maintenance constitutes an ongoing condition and is not subject to further permitting requirements.
12. If this ORAD involves work as part of a Simplified Review, the ORAD shall be recorded at the Registry of Deeds prior to the commencement of work per the requirements of Section F.
13. Prior to proceeding with any work under Simplified Review, applicants are required to provide written notice to the Commission one week prior to commencing any work.
14. If work authorized under Simplified Review is commenced, no work is allowed, and no additional NOI or RDA may be filed, for any work within the 0-to-50-foot buffer zone during the term of an ORAD associated with this application. If work authorized under Simplified Review is **not** commenced, then future NOIs or RDAs may be filed for work within the 0-to-50-foot portion of the buffer zone.

--End of Conditions--

WPA Form 4B – Order of Resource Area Delineation

Massachusetts Wetlands Protection Act M.G.L. c. 131, §40

C. Simplified Buffer Zone Review (cont.)

Stormwater Applicability

- 1. The project is not subject to the Stormwater Policy.
- 2. The project is subject to the Stormwater Policy and the Stormwater Plan included for the project complies with all stormwater standards.

Ineligibility Determinations

Site Conditions: The applicant is not eligible for Simplified Buffer Zone review and must file a Request for Determination of Applicability or Notice of Intent prior to any work because:

- 3. Work is within the Buffer Zone of a Coastal Resource Area as defined at 310 CMR 10.25-10.35.
- 4. The Buffer Zone contains existing slopes greater than an average of 15%.
- 5. Buffer Zone contains estimated rare wildlife habitat.¹
- 6. The site borders an Outstanding Resource Water.²

Stormwater

- 7. The project is subject to the Stormwater Policy and the applicant has not submitted sufficient information to demonstrate compliance with the Stormwater Management Policy. Prior to any work, the applicant must submit plans showing compliance with the standards in the Stormwater Policy, the location of the work, the amount of impervious surface, and the location of erosion controls, to the Commission for its concurrence. (See instructions to ANRAD Form 4A.) The following necessary stormwater information was not submitted by the applicant:

a. _____

- 8. The project is subject to the Stormwater Policy but the project does not comply with one or more of the stormwater standards (specify which standard(s) not met).

a. Standard # _____ :

b. Standard # _____ :

- 9. Impervious surface exceeds 40% of the area of the Buffer Zone between 50 and 100 feet from the resource area.
- 10. The applicant did not submit plans depicting adequate erosion and sedimentation controls located at the limit of work or at least 50 feet from any resource areas, whichever will be greater.
- 11. Work is proposed within 50 feet of a resource area.

Notice to Commission

Any applicant proposing to proceed under Simplified Buffer Zone Review, as specified in 310 CMR 10.02, must provide written notice to the Commission one week prior to any work.

¹ Identified on the most recent Estimated Habitat Map of State-listed Rare Wetlands Wildlife of the Natural Heritage and Endangered Species Program.

² Certified Vernal Pools, public water supplies, or inland ACECs as identified in 314 CMR 4.00.

WPA Form 4B – Order of Resource Area Delineation

Massachusetts Wetlands Protection Act M.G.L. c. 131, §40

D. Findings

This Order of Resource Area Delineation determines that the Stormwater Plan, if applicable, and the boundaries of those resource areas noted above, have been delineated and approved by the Commission and are binding as to all decisions rendered pursuant to the Massachusetts Wetlands Protection Act (M.G.L. c.131, § 40) and its regulations (310 CMR 10.00). This Order does not, however, determine the boundaries of any resource area or Buffer Zone to any resource area not specifically noted above, regardless of whether such boundaries are contained on the plans attached to this Order or to the Abbreviated Notice of Resource Area Delineation.

The Agent or members of the Conservation Commission and the Department of Environmental Protection shall have the right to enter and inspect the area subject to this Order at reasonable hours to evaluate compliance with the conditions stated in this Order, and may require the submittal of any data deemed necessary by the Conservation Commission or Department for that evaluation.

If the Abbreviated Notice of Resource Area Delineation was filed as Simplified Review for a Buffer Zone project, the applicant has certified that any work associated with the proposed project meets all eligibility requirements for Simplified Review listed in Section C of this Order. Any work that does not comply with the Simplified Review requirements will require a Notice of Intent or Request for Determination of Applicability.

The applicant is responsible for promptly requesting a Certificate of Compliance following completion of any work allowed pursuant to a Simplified Review or no later than three years from the date of the Order of Resource Area Delineation unless the Order is extended.

Failure to comply with the conditions of this Order is grounds for the Conservation Commission or the Department to take enforcement action.

This Order must be signed by a majority of the Conservation Commission. The Order must be sent by certified mail (return receipt requested) or hand delivered to the applicant. A copy also must be mailed or hand delivered at the same time to the appropriate DEP Regional Office (see <http://www.mass.gov/dep/about/region/findyour.htm>).

E. Appeals

The applicant, the owner, any person aggrieved by this Order, any owner of land abutting the land subject to this Order, or any ten residents of the city or town in which such land is located, are hereby notified of their right to request the appropriate DEP Regional Office to issue a Superseding Order of Resource Area Delineation. When requested to issue a Superseding Order of Resource Area Delineation, the Department's review is limited to the objections to the resource area delineation(s) stated in the appeal request. The request must be made by certified mail or hand delivery to the Department, with the appropriate filing fee and a completed Request for Departmental Action Fee Transmittal Form, as provided in 310 CMR 10.03(7) within ten business days from the date of issuance of this Order. A copy of the request shall at the same time be sent by certified mail or hand delivery to the Conservation Commission and to the applicant, if he/she is not the appellant. Any appellants seeking to appeal the Department's Superseding Order associated with this appeal will be required to demonstrate prior participation in the review of this project. Previous participation in the permit proceeding means the submission of written information to the Conservation Commission prior to the close of the public hearing, requesting a Superseding Order or Determination, or providing written information to the Department prior to issuance of a Superseding Order or Determination.

The request shall state clearly and concisely the objections to the Order which is being appealed and how the Order does not contribute to the protection of the interests identified in the Massachusetts Wetlands Protection Act, (M.G.L. c. 131, § 40) and is inconsistent with the wetlands regulations (310 CMR 10.00). To the extent that the Order is based on a municipal bylaw or ordinance, and not on the Massachusetts Wetlands Protection Act or regulations, the Department of Environmental Protection has no appellate jurisdiction.

G. Recording Information

If this Order is issued for purposes of Resource Area Delineation only, this Order should NOT be recorded.

If this Order of Resource Area Delineation is issued as part of a Simplified Review, this Order must be recorded in the Registry of Deeds or the Land Court for the district in which the land is located, within the chain of title of the affected property. In the case of recorded land, the Final Order shall also be noted in the Registry's Grantor Index under the name of the owner of the land subject to the Order. In the case of registered land, this Order shall also be noted on the Land Court Certificate of Title of the owner of the land subject to the Order of Conditions. The recording information on Page 6 of this form shall be submitted to the Conservation Commission listed below.

C. Geotechnical Analysis

YANKEE ENGINEERING & TESTING, INC.

November 27, 2009

Mr. Mike Pagano
Lamoureux Pagano Associates, Inc.
10 East Worcester Street
Worcester, MA 01604

**RE: Geotechnical Investigation Summary
Sherwood Middle School
Sherwood, Massachusetts**

Project # 29071

Dear Mr. Pagano:

Per our agreement, Yankee Engineering has completed the geotechnical investigation for the above site. Two (2) copies of the report, including the specific subsurface data and professional engineering conclusions and recommendations, are enclosed.

In general, the soils across the area of the proposed building area (B-1 to B-10) consisted of 1'-2' of surficial topsoil or fill overlying a brown silty sands (slightly plastic/clayey) with little gravel, which were judged to be undisturbed soil, that extended to the refusal depths. The 10'± depths at B-1 to B-4 (located near the top of the slope) were believed to be bedrock (corresponding to elevation 576' to 584'). The 9'± depths for B-5 to B-8 (located near the toe of the slope) showed bedrock (elev. 570' to 574'). Borings B-9 and B-10, situated 75' west of the existing school, found bedrock at depth of 17.5' and 8', respectively, correlating to elevations 570' and 582'. Boring B-11 to B-13, in the playfields to the south of the school, went at least 15' deep (8'+ below the water table) indicating that shallow bedrock was not a concern.

The blow counts indicated the native silty sand to be at least medium dense and suitable for typical foundation support. However, the soil has high fines (%<#200 sieve) content and should be considered extremely susceptible to moisture/vibration. As such, it must be protected during construction and would not be suitable for reuse as structural backfill.

Based on the recovered soil(s) and measured penetration resistance(s), the proposed areas appeared suitable for typical spread and/or continuous footing type foundations, bearing on the native silty sands using a bearing capacity of not more than 2 TSF (4000 psf).

We appreciate this opportunity to be of service to you. Should you have any questions relative to this report, or require additional services, please do not hesitate to contact me at our Worcester office.

Very truly yours

Whitney J. Parker, P.E.

PROJECT # 29071

NOVEMBER 27, 2009

RE: Geotechnical Investigation (2)
Sherwood Middle School
Shrewsbury, Massachusetts

Project # 29071

1.0 INTRODUCTION

This report presents the results of our geotechnical investigation for the proposed Sherwood Middle School addition in Shrewsbury Massachusetts. The purpose of the review was to obtain information regarding subsurface conditions and soil properties, for use in developing the geotechnical engineering recommendations for the structure, slabs, and paved areas.

2.0 SITE LOCATION & DESCRIPTION

The site, as stated above, consists of a 14± acre property located along the southern side of Sherwood Avenue, in the City of Shrewsbury, as shown in Figure 1, and has 300'± of frontage. An existing three (3) story brick framed structure occupies the northeastern site quadrant. The new 3 story building (footprint of 45,000± s.f.) will likely be situated to just west of the existing structure, although several borings (B-11 to B-13) were requested for the southeastern quadrant.

The rear half of the property is primarily playfields, and slopes from an elevation of 582'± along the rear of the building, to 574'± near the southern limits of the site, based on a supplied site topographical plan.

3.0 INVESTIGATIONS

3.1 FIELD SERVICES

A series of thirteen (13) soil borings (B-1 to B-13) was performed by Soil Exploration Services on November 19th and 20th 2009, under direction of Mr. Rick McCarthy, a Yankee geotechnical engineer. The borings were advanced using 6 inch o.d. hollow stem augers, driven by a truck mounted mobile boring rig. The boring locations, shown in Figure 2 (Boring Location Plan) were determined in the field by taping from identified landmarks, while the boring ground elevations were interpolated from contours shown on the site plan. Thus, the boring locations should be considered accurate only to the degree implied by the applied methodology.

Standard penetration resistance, generally at 5' increments was measured using an 24" long 2" o.d., split spoon sampler driven by a 140 lb. weight falling 30 inches. The recorded values, commonly referred to as blow counts, are listed on the individual soil boring logs, shown in Appendix A. The recovered samples, visually classified in the field, were recorded and stored in the event that further review is warranted.

Borings B-1 through B-10 were believed to encompass the general area of the proposed addition footprint and intended to sample soils near the expected footing elevation. It was assumed that purpose of borings B-11 to B-13 (to the south of the school) was for use in evaluating a possible alternate location.

RE: **Geotechnical Investigation** (3)
Sherwood Middle School
Shrewsbury, Massachusetts

Project # 29071

3.2 LABORATORY SERVICES

As a majority of the recovered soil samples were visually quite similar, this office elected to perform gradation analyses according to ASTM D-422 washed sieve test methods, on three (3) recovered samples. These samples, from a depth of 5 to 7' from boring B-1, B-3 and B-6, showed a soil classification of SM: brown (slightly plastic/clayey) silty sand with little gravel. The laboratory gradation results, presented in Appendix B, showed 40%+ silt/clay (%<#200 sieve) contents indicating the subsurface silty till to have a very high "fines" content, which is addressed in detail later in this report.

4.0 OBSERVED CONDITIONS

4.1 SUBSURFACE SOILS

In general, the subsurface soil across top of the slope, near the north side of the proposed addition (B-1 to B-4), consisted of 2' of surficial pavement/gravel fill overlying the brown medium dense silty till (native silty sands with little gravel, described above). This silty till extended down to suspected weathered bedrock at boring depths of 10' to 13' (correlating to elevations 576' to 581') at B-1 and B-3, respectively.

B-5 to B-8 along the south side of the addition footprint (located near the toe of the slope) showed 1'± of surficial topsoil/subsoil overlying the undisturbed medium dense brown silty till. The 9'± drilling depths, also believed to be bedrock, correlated to elev. 570' and 574', at B-5 and B-8, respectively.

Borings B-9 and B-10, situated 75' west of the existing school, encountered similar medium dense silty till with bedrock at 17.5' and 8' respectively, correlating to elevations 570' and 582'. B-11 to B-13, in the playfield areas to the south of the school, went at least 15' deep (which was 8'+ below the water table) indicating that shallow bedrock was not a concern. It should be noted that none of the borings found evidence of foundations, loose soil, or "variable fill soil(s)".

4.2 GROUNDWATER OBSERVATIONS

In the northern addition area, groundwater was encountered within the silty till at depths of 9' at B-1 (elev. 577') and 4' at borings B-4 (elev. 580'). However, in the southern part of the property, borings B-11 to B-13 found wet soil at about elevation 570'. As such, it appears the general groundwater table follows the surface contours, from north to south, but also appears to be perched (trapped) at variable elevations within the native silty till. We do not believe that it will impact the expected shallow foundation construction operations, however deeper excavations, for utilities etc., may approach the groundwater table. Further, it should be noted that fluctuations of the ground water table will occur due to precipitation and seasonal changes. As such, readings taken under different conditions may vary somewhat from those presented in this report.

Project # 29071

5.0 GEOTECHNICAL EVALUATION

5.1 FOUNDATIONS

Judging from the blow counts and soil type(s), it is our professional opinion that, in accordance with Section 1804.3 of the Massachusetts State Building Code, the maximum allowable net soil bearing capacity of the medium dense, silty sands with little gravel (Class #8), near the expected footing elevation is 2 TSE (4000 PSF). Further, as the area is underlain by soil consisting of medium dense Class #8 soil, according to State Code Table 1612.4.1, the site is a soil profile type S₂, having a site seismic coefficient of 1.2. The subsurface soil conditions were not considered to be susceptible to liquefaction, according to CMR 1805.3, due to their fine grained composition and high relative density.

According to the State Code 7th edition, section 9.4.1.2.1, the boring data/blow counts and soil gradation results dictate that the site be given a Class "D" classification.

Footings should be designed in accordance with Section 1806 of the State Code. For footings smaller than 3 feet in least lateral dimension, the allowable bearing pressure should be reduced to one-third of the above value multiplied by the least lateral footing dimension in feet. We recommend that continuous wall footings be a minimum of 18" wide and isolated footings at least 24" wide. All exterior and interior footings in unheated areas should bear a minimum of 4' below finish grade to provide protection from frost penetration. We suggest that interior footings, in heated areas, should bear at least 18" below the underside of the floor slab.

The static lateral earth pressure for any unrestrained foundation walls, which will effectively serve as retaining walls with greater than 4' exposed, should be calculated using an equivalent fluid pressure of 60 pcf (pounds per cubic foot). This value is based on the interior backfill consisting of granular soils, having less than 10% silt (% < #200 sieve), being compacted to greater than 95%. Additional pressure exerted from interior slab surcharge loads (acting within 1.5 times the exposed wall height) should be considered as a uniform pressure equal to $0.5q$, where q (psf) is the surcharge load.

5.2 SLABS ON GRADE

The existing native silty tills when compacted and stable are suitable to remain as subgrade (up to 12" below slab grade) material beneath the floor slab(s) on grade. We recommend a minimum 12" thick slab base course layer, meeting the Base Gravel specifications as presented hereinafter. The slab gravel will have to be imported as the onsite soils will not meet the Base Course requirements. Further, it must be noted that the existing subgrade soils are moisture sensitive and may destabilize if exposed to excessive moisture and/or equipment traffic. Thus, the building area and subgrade soils will require some weather protection, during construction, to maintain their suitable density and stability.

YANKEE ENGINEERING
& TESTING, INC.

RE: **Geotechnical Investigation** (5)
Sherwood Middle School
Shrewsbury, Massachusetts

Project # 29071

5.3 PAVEMENTS

The existing undisturbed silty till appears suitable in its nature state, to remain as subgrade material beneath paved areas. However, as mentioned above, they are moisture susceptible and will require protection depending on the construction season. Based on the fine grained subgrade soil and expected light vehicle traffic, we recommend a 12" thick sub-base layer of Base Gravel, topped by 4 inches of Dense Graded crushed gravel. The dense mix is warranted as the silty subgrade soils are relatively weak due to their elevated fines content. The increasing strength of the proposed pavement base layers should provide adequate support for the bituminous asphalt.

6.0 RECOMMENDATIONS

6.1 GENERAL SITE PREPARATION

The building area could be stripped down to the underlying natural silty sands prior to commencing construction, in order to salvage/segregate the existing pavement "base gravel" for re-use. Care must be taken to avoid degrading the soil quality by mixing it with the underlying silty till or bituminous asphalt. We recommend that the contractor proof roll the exposed soil subgrade in open areas, with at least ten (10) passes of a vibratory drum roller, having a minimum static weight of 10,000 pounds. Over-excavate any weak or soft spots, identified during proof rolling, and replace them with compacted granular fill, where necessary.

In more confined areas, such as footing trenches, we suggest that a vibratory compactor be applied until passing field compaction results are obtained. Again, any weak or soft areas should be excavated and replaced with compacted granular fill material.

The following material soil gradations specifications are recommended for Granular Fill, Gravel Base, and Dense Mix, respectively:

<u>Sieve Size</u>	<u>Granular Fill</u>	<u>Gravel Base</u>	<u>Dense Mix</u>
6 inch	100	100	100
3 inch	95 - 100	100	100
1/2 inch	60 - 95	50 - 85	50 - 80
No. 4	50 - 80	40 - 75	30 - 55
No. 10	30 - 70	30 - 60	n/a
No. 40	10 - 70	10 - 35	10 - 25
No. 100	0 - 25	5 - 20	n/a
No. 200	0 - 10	0 - 8	3 - 10

All backfill materials shall be free from ice, snow, roots, and/or other deleterious matter.

**RE: Geotechnical Investigation (6)
Sherwood Middle School
Shrewsbury, Massachusetts**

Project # 29071

Place and compact granular fill up to the required subgrade elevation(s). The recommended minimum compaction, expressed as a percentage of the maximum dry density, when tested in accordance with ASTM D-1557, is specified below:

<u>General Fill Location/Type</u>	<u>Percent Compaction (D-1557)</u>
Beneath All Footings & Slabs	95%
Pavement Base Course Material	95%
Beneath Pavement Base Course	92%
Beneath Landscape Areas	90%

6.2 FOUNDATIONS

The bearing soils, at the bottom of any foundation trenches, should be re-compacted (i.e. proof rolled) using vibratory equipment of sufficient weight to obtain the specified 95% minimum compaction. Should the soil(s) become destabilized (weaving/pumping) the contractor may be required to over-excavate the footing trenches and prepare a 1'± thick lift of crushed stone (1-1/2" max. or similar) to stabilize the subgrade and provide temporary drainage during construction. The contractor may also be required to construct stone "sump points" to collect/remove water from open excavation(s)

Backfilling of foundation walls should be performed on both sides to avoid unbalanced fill loading. In general, lift thickness during backfill should not exceed 6" when utilizing hand-operated, vibratory plate compactors, and 10 -12" when using walk-behind, dual drum, or vibratory rollers, unless sufficient means of compaction otherwise can be demonstrated to the satisfaction of the architect and/or engineer.

6.3 SLABS ON GRADE

As mentioned previously, the existing undisturbed silty till should be suitable to remain as slab subgrade provided it does not become destabilized during construction. We also recommend a minimum 12" thick lift of compacted Base Gravel for directly beneath the slab, in order to create a suitably strong, non-yielding bearing surface for slab. Again, it must be noted that it is critical that the contractor protect the native silty sand subgrade and avoid the repeated vibration/loading associated with "traffic routes".

6.4 PAVEMENTS

As previously mentioned, the existing native silty till, is suitable to remain as pavement subgrade provided they do not become destabilized during construction. Also, 12" of compacted Base Gravel sub-base and a minimum 4" of Dense Grade (intended to produce a gradable hard surface) is recommended for directly beneath bituminous pavement. Given the expected light traffic conditions, consisting primarily of personal vehicles, we typically suggest a pavement cross-section consisting of 2" of bituminous binder with 1-1/2" of top mix. All materials and placement procedures should be in accordance with the State Highway & Bridge specifications and standards.

RE: **Geotechnical Investigation** (7)
Sherwood Middle School
Shrewsbury, Massachusetts

Project # 29071

7.0 CONSTRUCTION MONITORING

We recommend that Yankee Engineering & Testing, Inc. be retained to monitor aspects of the foundation and pavement construction operations which are listed below:

- Monitor the removal of unsuitable materials from the footing and floor slab areas, and to confirm that the type of material encountered at subgrade level is adequate.
- Review the proposed bearing surfaces to confirm that they have been properly prepared, and that they are satisfactory for the recommended bearing pressures.
- Observe the placement and compaction of controlled fills within the building footprint and proposed pavement areas.
- Check the suitability, via project specifications, of soils proposed for use as backfill.

By monitoring these aspects of the construction, we will be able to observe compliance with the design concepts, assumptions, and specifications, and to facilitate the design changes in the event that subsurface conditions differ from those anticipated prior to the start of construction. In addition, *Yankee* would be pleased to provide the full range of future testing/inspection services, as required by the State Building Code.

We believe that your will find the information and engineering opinions expressed herein to be clear and concise. However, should you have any questions or require additional geotechnical services, please do not hesitate to contact me at our Worcester office. We appreciate this opportunity to be of service to your firm.

LIMITATIONS

- The analyses and recommendations submitted in this report are based upon the data obtained from the subsurface explorations. The nature and extent of variations between these explorations may not become evident until construction. If variations then appear evident, it may be necessary to reevaluate the geotechnical engineering recommendations contained in this report.
- The generalized soil profile(s) is intended to show trends in the subsurface soil conditions. The boundaries between strata are approximated and have been developed by interpretation of the widely spaced explorations and samples. The actual soil transitions are probably more erratic.
- Water level readings have been made in the explorations at the times, and under the conditions, stated on the boring logs. However, it must be noted that fluctuations in the level of the groundwater will occur due to variations in rainfall, season, temperature and other factors.
- In the event that changes in the nature, design, or location of the proposed buildings are planned, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed and conclusions of this report modified or verified in writing by the preparer.
- It is recommended that this firm be provided the opportunity for a review of the final construction design and specifications, in order to confirm that the earthwork and foundation recommendations are properly implemented.
- It is recommended that this firm be retained to provide the geotechnical engineering services during construction of the excavation and foundation phases of the work. This is to observe compliance with the design concepts, material specifications and engineering recommendations, and to allow for changes in the event that conditions differ from those anticipated.
- This report has been prepared for the exclusive use of Lamoureux Pagano Associates for specific applications to the Sherwood Middle School site, located in Shrewsbury, Massachusetts, in accordance with accepted foundation engineering practices. No other warranty, expressed or implied, is made.
- This report should be considered for foundation design purposes only, and is not sufficient to prepare an accurate or complete bid. Contractors wishing a copy of the report may secure it with the understanding that the reports scope is limited to general design considerations only.

1.15 PREFERRED SCHEMATIC DESIGN

D. Utility Analysis

Sherwood Middle School

Sherwood Avenue, Shrewsbury, MA 01545

1.15 PREFERRED SCHEMATIC DESIGN

SCHEMATIC DESIGN

D. Utility Analysis

The design team reviewed the available utilities and determined that the projected needs can be accommodated by the on site capacity. In particular, the following was reviewed more closely:

GAS: NStar representatives indicated that approximately 6000cfh of gas is available for the site currently. Consultants anticipate a need for 5530cfh for boilers, water heaters, and kitchen loads. NStar reserved the option to reconsider the capacity closer to construction time depending on any unanticipated natural gas demands that may occur in the interim period.

FIRE PROTECTION: On site hydrant flow tests conducted in July, 2009 showed adequate flow and pressure to support the fire protection system for the Sherwood project. At the hydrant on side playground/parking area, the static pressure was 85 lbs. And the pressure was 42 lbs. At the hydrant in front of the school, the flow was 840gpm and the pressure was 25 lbs.

ELECTRIC/CABLE/TELECOMMUNICATIONS: are all provided by Shrewsbury Electric Light Company (SELCO). On October 28, 2009, proposed plans were reviewed and approved by SELCO representatives and a primary electric route was designated for the new school that will allow the existing school to operate uninterrupted during construction.

SANITARY: A new connection to a Crescent Street sanitary structure was developed that will not require an ejector pump.

1.15 PREFERRED SCHEMATIC DESIGN

E. Code Outline

This narrative is intended to outline the basic code parameters as required by the 7th Edition of the Massachusetts State Building Code, 780 CMR.

The narrative addresses the pertinent construction and life safety issues of the code in sequential order of the code's chapters that affect the design of the proposed school.

- **Chapter 3 "Use and Occupancy Classifications"**

Use Group E – Educational

Assembly areas (gym, cafeteria, library): Accessory assembly uses, not required to be a separated use group. Administrative offices constitute less than 10% of the floor area and therefore considered accessory use and not required to be a separated use group. Incidental use areas to be separated by automatic fire extinguishing system.

- **Chapter 4 "Special Detailed Requirements on Use and Occupancy"**

The gymnasium includes a platform for school presentations. The platform framing will be constructed of non-combustible materials. There is no requirement for a fire curtain, rated enclosure, roof vents or standpipe system.

- **Chapter 5 "General Building Heights and Areas"**

Per Table 503 "Allowable Height and Building Areas"

For Use Group E, Type 2B construction (non-combustible) the allowable floor area is 14,500 sq. ft. per floor and maximum two (2) stories in height.

Allowable number of stories increases by one (1) story with automatic sprinkler system.

Increase in area due to area modification factors for frontage increase for accessibility to building perimeter and automatic sprinkler increase as follows:

The perimeter is 100% accessible by public way or open space 20 feet wide or greater, therefore a 75% increase in floor area would be allowed per code for additional frontage.

The building will have an automatic sprinkler system which allows for a 200% increase in floor area per code.

Based on the modification factors the allowable maximum single floor area for the school is 54,375 square feet.

The actual area (area as defined by the code) is 55,902 square feet on the main level which exceeds the maximum allowable of 54,375 square feet, ground and second floor are each less than the allowable. The building will employ the use of a fire wall, separating the school into two buildings of 45,330 and 10,572 square feet, each area within the allowable maximum area. It should be noted that the fire wall is located within the building, to simultaneously act as the code required seismic/expansion joint.

- **Chapter 6 “Types of Construction”**

School to be 2B Construction – Non-Combustible with full automatic sprinkler system. Fire-resistance rating of structural frame, interior walls and partitions (except as noted below), floor and roof construction to be 0 Hours.

Elevator Machine Room and shaft, Emergency Electric Room to be of 2 hour construction.

Exit stair enclosures to be of 1 hour construction. Two story open stair in main lobby allowed with automatic sprinkler system.

- **Chapter 7 “Fire Resistance-Rated Construction”**

Fire wall to be 2 hour construction, all penetrations to be 1-1/2 hr. labeled fire protective.

Exterior wall construction to have 0 fire rating due to fire separation distances in excess of 30 feet to property line of buildings, other than adjacent building separated by fire wall.

Shaft enclosures for ductwork to be 1 hour rated. Ductwork shall be constructed to provide fire resistance rating of 1 hour and not require fire dampers.

Duct penetrations of assemblies greater than 1 hour construction to have fire dampers. Fire blocking not required in non-combustible construction. Draftstopping required at rated wood gym floor system.

- **Chapter 8 “Interior Finishes”**

Wall and ceiling finishes to be Class C or better. Floor finishes to be minimum of Class II materials. Wood flooring permitted at platform.

Furnishings not required to comply with Cal 133 Fire Code Standard due to use of quick response sprinkler heads.

Sherwood Middle School

Sherwood Avenue, Shrewsbury, MA 01545

SCHEMATIC DESIGN

1.15 PREFERRED SCHEMATIC DESIGN E. Code Outline

- **Chapter 9 “Fire Protection and Live Safety Systems”**

School to have automatic sprinkler system, detection and emergency alarm systems, and portable fire extinguishers located per NFPA 10.

- **Chapter 10 “Means of Egress”**

Corridors, stairs and doors sized to exceed minimum unit width per occupant.

All rooms exceeding 50 occupants to have 2 exits adequately separated. Gymnasium to have 500 occupants and 3 exits. Cafeteria to have 300 occupants and 2 exits.

- **Chapter 11 “Accessibility”**

School compliant with Architectural Access Board Regulations, 521 CMR.

- **Chapter 12 “Interior Environment”**

Refer to Mechanical and Electrical Narratives

- **Chapter 13 “Energy Efficiency”**

Refer to Mechanical and Electrical Narratives

- **Chapter 16 “Structural Design”**

Technology

December 4, 2009

Mr. Michael Pagano
Lamoureux Pagano and Associates, Architects
14 East Worcester Street
Worcester, MA 01604

Re: Sherwood Middle School Structural Narrative

Dear Mr. Pagano,

The Sherwood Middle School consists of about 130,000 sq. ft. of one-, two-, and three-story buildings. The project conforms to Type 2B Construction.

It is assumed that the foundations will be spread footings supported on natural glacial till or compacted structural fill with a bearing capacity of 4 ksf. The perimeter concrete foundation walls have a width sufficient to eliminate the need for forming wall pilasters. Our assumptions are based on Yankee Engineering & Testing, Inc.'s "Geotechnical Investigation Report," dated November 27, 2009. The foundation also includes a fourteen-foot high, cantilevered retaining wall between the basement and first floor level within the footprint of the building.

The first floor will be a 5" thick concrete slab-on-grade reinforced with welded-wire fabric (6x6-W2.9 W2.9). Rigid insulation under the slab provides the necessary properties to satisfy the new Massachusetts Energy Code. Control joints, consisting of sawn cuts and construction joints, will be shown on the plans, and will be located at about 20 feet on center to minimize shrinkage cracks in the slab.

The second floor, and any other framed slabs, will be a 5½" thick concrete composite slab supported on steel beams. 3"-18 Gauge composite metal deck will be specified and the slab will be reinforced with welded wire fabric (6x6-W2.9 W2.9). The composite concrete slab is made composite with the steel beams by using shear studs, and "partial composite design" is used for the economy of installing fewer shear studs. ASTM A992, with yield strength of 50 ksi, will be specified for the structural steel. However, the beams will be selected on serviceability requirements to reduce the problems of vibrations and deflections, so they will not necessarily be fully stressed.

The roof framing will incorporate both steel beam and open web steel joists. In areas with many HVAC roof units only steel beams will be used to support the equipment and the associated snowdrift loads. The roof steel pitches to the roof drains to reduce the amount of tapered insulation. The roof metal deck will be 1-1/2"-20 Gauge, Type B. Over the Gymnasium, the roof deck will be Cellular Acoustic.

Wherever possible, hollow structural shapes will be selected for the columns. HSS6x6 tubes are easily concealed in the wall and partition framing eliminating the need for pilasters in the concrete foundation walls or interior partitions. Columns that are part of the lateral force resisting moment frames, or columns required to resist lateral wind pressures will typically be wide flange shapes.

The lateral stability of the buildings will be achieved with ordinary steel moment frames, concentrically braced frames, concrete shear walls, concrete floor diaphragms, and metal deck roof diaphragms. The Classroom Building will be structurally isolated from the Gymnasium Building with an expansion joint. The main lateral force resisting system of the Classroom Building will be ordinary steel moment frames. The main lateral force resisting system of the Gymnasium Building will be mainly concentrically braced frames. Typically, the concentrically braced frame members will be HSS shapes and will resist the lateral loads in both tension and compression.

Please call this office if you wish to discuss these items or any other aspect of the project.

Bolton & DiMartino, Inc.

Christopher Tutlis, P.E.
Associate

PLUMBING AND FIRE PROTECTION SYSTEMS NARRATIVE

1. PLUMBING SYSTEMS:

Criteria Listing

*Massachusetts State Building Code, Seventh Edition, 780CMR
 Commonwealth of Massachusetts “Fuel Gas and Plumbing Code”, 248CMR
 National Fuel Gas Code NFPA 54-1992*

Permitting Requirements

Permitting and filing phase will be in accordance to Section 1.12K.

Fixtures and Fixture Count

Number of plumbing fixtures will be added in the facility to accommodate population of 450 male students and 450 female students and shall be in accordance with 248 CMR Paragraph 10.10, Table 1. .

Plumbing fixtures will be equipped with the following water conserving features (for 30% indoor water use reduction-MA-CHPS WC 1.1)

<i>Water Closet</i>	<i>Urinals</i>	<i>Lavatory</i>
<i>Dual Flush Valve (Sloan WES-111, 1.6 gpf up and 1.1 gpf down) Or Electronic sensor 1.28 gpf flush valve (Sloan 8111-1.28)</i>	<i>Electronic sensor ultra low flow flush valve type-0.25gpf (Sloan WEUS 1002) Or Waterfree Urinals (Sloan WES-1000)</i>	<i>Sloan Optima EAF-275-ISM “Solis” solar powered, sensor activated, hand washing faucet with integral spout temperature mixer, 0.5 gpm flow restricting aerator spray head and field adjustable run time limit setting.</i>

Water closets and urinals will be commercial vitreous china, wall hung (ADA compliant). Lavs will be self-rimming counter mounted china. Each floor includes a janitor’s closet with a corner mop service basin. Toilet cores on each floor will include alcove-recessed electric water cooler, in a high-low handicapped accessible configuration. Toilet and mechanical room will have a floor drain with trap primer.

All classrooms will have self-rimming stainless steel sink with gooseneck type faucets (Chicago#786-GN). Plumbing connecting and faucets will provided to each kitchen

appliances requiring plumbing work. Exterior non-freeze wall hydrants will be provided on all side of the school building.

Roof Storm Drainage

Roof Drain system will carry rain water away from the flat roof of the new building with conventional primary roof drains.. The surface of the roof deck will be drained with dual level promenade drains (a minimum of two) with the lower drain bodies flashed into the waterproofing membrane. RW piping and the system will be sized to handle a rainfall rate of 4 inches per hour, with a total runoff from the main roof and the roof deck of just under 1 cubic foot per second. The storm system will be installed in cast iron piping with all horizontal piping insulated to prevent condensation. The storm system will exit along the side of the building and connect to the site storm water collection system.

Sanitary

The 6” sanitary waste system will drain by gravity and will run to exit the building and connect to the new sewer system at the site

A dedicated 4” grease waste line will be installed to collect grease laden waste water from the new Kitchen appliances and fixtures. The grease line will exit the building adjacent to the Sanitary Sewer and will be connected to an exterior grease trap outside the building. For culinary sink or prep sinks grease tarp will be provided at the source. Above ground sanitary drainage and will be piped in cast iron with “no-hub” joints.(3” or larger) . Piping smaller than 3 inch will be piped in copper. Piping below floor shall be weight cast iron hub and spigot

Domestic Cold Water Service

New main 4” domestic water supply in the mechanical room will enter from Sherwood Avenue. Reduced Pressure Backflow Preventer will be provided to the main domestic water supply to protect the service (per the DEP regulation 310 CMR 22). Boiler water feed and make-up, and any other mechanical take-Offs will branch off through a reduced pressure-principle backflow preventer.

The domestic cold water piping inside the building will be distributed in “L” type copper tube with wrought or cast copper fittings. The piping will be insulated to prevent condensation.

Domestic Hot Water Service

Two high efficiency gas fired water heaters.(100 gallon, 270 GPH water heaters similar to A.O Smith BTH-250) will be manifold together to supply hot water distribution to classroom fixtures. One high efficiency gas fired water heater will be dedicated for the kitchen appliance hot water requirement. The domestic hot water distribution system will

be in re-circulating system to the fixtures, with no dead leg more than 12” in length. There will be 2 different hot water supply / recirculation systems in the building. One system will operate at 140°F and will serve the kitchen dishwasher and 3 compartment sink. The other system will operate at 120°F and will serve the other kitchen sinks and appliances, as well as the custodian room sinks, lavatories and classroom sinks. At the lavatories, the faucets will reduce the temperature to 110°F at the lavatories, and 105°F in the Pre-K toilet rooms and class rooms sinks.

Domestic hot water will be distributed in “L” type copper tube with wrought or cast copper fittings. The hot water (HW), and re-circulating (HWC) piping will be insulated for energy savings. No HW or HWC piping will be concealed beneath the slab.

Natural Gas

New gas service sized for 5,000 cfh building load will enter the boiler room and will be regulated to low pressure (11” W.C) inside the building. The exterior pressure regulators and gas meter will be mounted on the outdoor steel rack. The gas meter and regulator will be by the gas utility company. The new 6” gas supply inside the building will be piped to the heating boilers, gas-fired water heaters and food service equipment in the kitchen area. The gas piping will be distributed in ASTM A53 schedule 40 black steel pipe, and will be limited in the boiler room and kitchen work area. Thermally actuated shut-off valve will be used wherever the gas line penetrates through the exterior wall.

Sustainable Design Features:

All plumbing fixtures will be equipped with ultra low flow water conserving faucets in order to achieve 30% water reduction of water usage from the base design.

To receive maximum MA-CHPS credits, following plumbing measures will be considered for further evaluation during design development phase.

- *Reduce potable water use for sewage conveyance by storm water harvesting.*
- *Solar thermal water heater.*

FIRE PROTECTION SYSTEMS:

Criteria Listing

*Massachusetts State Building Code, Seventh Edition, 780CMR
National Fire Protection Association (NFPA) Codes
Permitting and filing phase will be in accordance to section 1.12K*

Sprinklers

Building will be served from the new 8" fire service line to the building from the Sherwood Avenue. Cross connection control shall be provided by use a supervised double check valve assembly backflow preventer on the water service as it enters the building in the Boiler Room.

The entire building shall be protected throughout with a wet automatic fire suppression system. A fire department Storz connection will be provided toward the parking lot. The FDC will either be wall-mount or free-standing, depending on the final details and the preference of the responding Fire Department AHJ. This system shall be designed in accordance with NFPA Standard 13, 2007, the Massachusetts State Building Code, 7th Edition and the Shrewsbury Fire Department requirements.

Sprinklers shall be supplied from the standpipes. Floor control valve stations, consisting of a monitored shut-off valve, flow switch and an Inspector's test valve and sight glass, shall be provided at each floor take-off from the standpipe system. This shall report sprinkler flow to the fire alarm system on a floor-by-floor basis.

Sprinkler heads in electrical and mechanical rooms shall be standard response, 212 degree temperature listing. Sprinklers in all other areas shall be quick response heads.

Standpipes: *Standpipes shall be supplied in all required egress stairs. Standpipes would be designed in accordance with NFPA Standard 14, 2007, and Shrewsbury Fire Department requirements. Standpipes shall be located in each required egress stairway, and adjacent to the Stage. Additionally, standpipes shall be located so that no part of the building is more than 200 feet from a standpipe valve. Each standpipe shall be equipped with a 2 1/2" fire department hose valve with 1 1/2" reducer at the stair floor landing. At the Stage, fire department valves shall be provided on each side of the stage. These shall be in recessed cabinets.*

Because the building is not a high rise, there is no minimum pressure requirement for the standpipes.

Fire Protection Systems: *Standpipes & sprinklers shall be supplied from a dedicated water service, entering the building in the Boiler Room. The building service shall be equipped with a wet main alarm riser check valve, located at the service entrance. From*

there, this line would run to each stairways, and then up through the stairways as standpipes.

Fire protection piping shall be schedule 40 piping with threaded fittings for any piping sized 2" and less. For sizes over 2", schedule 10 piping with roll grooved fittings and couplings shall be used.

All valves controlling the flow of water shall be equipped with supervisory devices that report to the Fire Alarm system. Kitchen hood will be protected with a dry agent "Ansul R-102" packaged hood suppression system

Following hydrant flow test information was obtained from the Shrewsbury town:

Static Pressure: 85 psi, Residual Pressure 43 psi, Flow 840 GPM

Based on the above hydrant flow data, we feel fire pump is not required. However hydraulic calculation will be required during design phase to determine the viability of such requirements.

I. EXECUTIVE SUMMARY

This report defines the Heating, Ventilating and Air Conditioning (HVAC) systems being proposed for the new Sherwood Middle School. In addition, it evaluates a base case system which meets the minimum state mandated energy performance requirements against various energy saving and high performance system options. The elected system option #2 and alternate #1, currently implemented into the design are shown on the submitted schematic drawings referenced in Appendix A.

The following briefly describes the major differences between the base case and options:

Base Case – Classroom Unit Ventilators:

Incorporates a standard efficiency 82% gas-fired boiler plant coupled to classroom unit ventilator systems and air handler coils supporting the heating and ventilation needs of the building. Unit ventilators support classroom areas whereas air handling systems support the administration, gym, café and lobby areas. Air cooled AC is provided on systems serving administrative office spaces and computer labs.

Advantages:

- Lower initial cost
- High operating cost

Disadvantages:

- Elevated noise levels in classroom
- High maintenance cost

Option #1 – Classroom Radiation & ERU's:

Incorporates a high efficiency 93%+ efficiency gas-fired boiler plant coupled to fin-tube radiation and air handler coils supporting the heating and ventilation needs of the building. Fin-tube radiation support classroom areas whereas air handling systems support the administration, gym, café and lobby areas. The ventilation needs of all the classroom areas are supported by total energy recovery units distributing reclaimed and tempered outdoor air to each classroom via a VAV terminal box which maintains constant airflow during all room occupied periods. Air handling systems support the administration, gym, café and lobby areas. The café system incorporates total energy recovery technology. Air cooled AC is provided on systems serving administrative office spaces and computer labs.

Advantages:

- Low initial cost
- Low operating cost
- Low noise in classroom

Disadvantages:

- No dehum. control in humid months

Option #2 (in lieu of Option #1) – Classroom Radiation & ERU w/ Dehum.:

Incorporates a high efficiency 93%+ efficiency gas-fired boiler plant coupled to fin-tube radiation and air handler coils supporting the heating and ventilation needs of the building. Fin-tube radiation support classroom areas whereas air handling systems support the administration, gym, café and lobby areas. The ventilation needs of all the classroom areas are supported by total energy recovery units distributing reclaimed and tempered outdoor air to each classroom via a VAV terminal box which maintains constant airflow during all room occupied periods. In addition, the classroom units have refrigerant based dehumidification cycles which use hot gas from the refrigeration cycle for reheating. Air handling systems

support the administration, gym, café and lobby areas. The café system incorporates total energy recovery technology. Air cooled AC is provided on systems serving administrative office spaces and computer labs.

Advantages:

- Low noise in classroom
- Improved comfort due to dehum. Control
- Tempered cooling from the dehum. process

Disadvantages:

- Slightly higher operation cost over Op.#1

Alternate #1 (in addition to Base Case or either Option #1 or #2) – Solar Wall.:

Advantages:

- Passive heating device
- Improved heating energy efficiency

Disadvantages:

- Added installed cost

The following table defines the economic differences between the respective options. Although Option #1 yields the best payback we have recommended **Option #2** being that it incorporates a space humidity control and inherent air tempering feature for the classroom areas during the more humid and warmer weather thereby providing improved comfort year-round over Option #1. All life cycles were run on an average life cycle of 20 years however life of equipment will vary such as boilers at 30 years and RTU's at 15+ years. Values below are in current dollars, simple payback method with no discount factor applied nor an escalation rate for energy or maintenance costs.

ECONOMIC COMPARISON SUMMARY

System	Installed Cost	Annual Energy Cost	Annual Maint.	20 year Life Cycle Cost	Annual Savings E & M	Simple Payback
Base Case	\$3,335,100	\$69,160	\$29,900	5,316,300	-----	-----
Option #1	\$3,386,000	\$60,706	\$16,900	4,938,120	\$21,454	2.4 years
Option #2	\$3,452,000	\$61,205	\$17,900	5,034,100	\$19,955	5.9 years
Alt. #1 w/ Base	\$52,850	-\$8,687* (-)savings	\$800	-\$104,890 (-)savings	\$7,687*	6.1 years*

**Information on alternate #1 provided by Solar Wall manufacturer. It is anticipated that the savings, when combined with either Option #1 or Option #2, will be less and the payback period will double to approximately 12+ years due to implementation of varying outdoor air flow routines included in both these options.*

II. HVAC NARRATIVE

A. DESIGN INTENT

The heating medium for the building shall be hot water generated by high efficiency condensing gas fired hot water boilers located in a ground floor boiler room. These boilers support the heating requirements of all areas of the building. The heating water is distributed to fin-tube radiation, VAV terminal units, air handler units, cabinet and unit heaters and fan coil units.

DX based air cooled space cooling equipment has been limited to support of the following areas: 1) Office /Administration, 2) Media Center, 3) Computer Labs, 4) Tel/Data MDF room. DX based dehumidification outdoor air pretreating systems are also provided for most all classroom spaces.

The air distribution systems consist of the following:

- a. Treated outdoor air (VAV) terminals in the classrooms.
- b. VAV terminals with reheat in administration areas.
- c. Classroom ventilation is supported with central packaged VAV air handlers on the roof complete with total energy recovery wheels, hot water coils and dehumidification cycles utilizing DX based system with hot gas reheat cycle.
- d. Central packaged VAV air handlers on the roof complete with total energy recovery wheels, hot water coils and DX cooling provide conditioned air to the spaces designate previously as being cooled. VAV terminals in these spaces control individual space temperature control.
- e. Central packaged VAV air handlers on the roof and/or in an upper level mechanical room with hot water coils provide conditioned air to the gymnasium, cafeteria and lobby areas. These systems have the ability to pretreat the incoming outdoor air by directing the incoming outdoor air thru a solar wall system located on the South wall of the gymnasium.
- f. Exhaust fans will vent specific areas such as bathrooms, storage areas and the kitchen.

The school is designed with a direct digital control (DDC) energy management system (EMS) that monitors and controls the HVAC equipment for efficient use. The system is designed on PC based architecture and adjustments are made on a graphics based presentation of building systems. The system also supports maintenance and record keeping needs of the facility. Occupancy of the school is based on the standard school year with occupied/unoccupied conditions based on current school day practice. This is an adjustable feature that can be made to reflect additional operating needs and use of the school building by staff or others.

The adjustable operating schedule, in general, is from 7:30 a.m. to 5:00 p.m., five days per week. It is expected that the building or certain areas within the building will also be used several evenings a week and occasionally on weekends.

The Designer of Record will certify that the HVAC systems have been installed in accordance with the approved construction documents, in conformance with Commonwealth of Massachusetts State Building Code 780 CMR Chapter 13.

B. BASIS OF DESIGN

The HVAC systems and components are designed in accordance with the requirements of the Commonwealth of Massachusetts State Building Code - 7th Edition, 780 CMR, and conform to the energy conservation requirements of Chapter 13 of that code.

The Sherwood Middle School is located in Shrewsbury, MA and complies with the criteria for Climate Zone 14a in Worcester County. The design criteria used for the development and sizing of the HVAC systems and components are:

Heating Degrees Winter:	-1°F
Cooling Degrees (db) Summer:	86°F
Cooling Degrees (wb) Summer:	73°F
Heating degree Days (base 65):	6894
Cooling Degree Days (base 65):	507

Interior design temperature set points are 72°F for heating and 75°F for cooling (for spaces with cooling cycles) during occupied conditions however setpoints in operation shall include a minimum 5 degree deadband between cooling and heating such as 70°F heating and 75°F cooling. Space conditions are allowed to drop to 62°F during the heating season and rise to 88°F during the cooling season when spaces are in the unoccupied condition. Morning warm-up or cool-down period is optimized to achieve design space conditions at the commencement of occupied periods.

Design occupant levels by space are contained within the architectural documents included as part of the approved schematic documents.

C. HVAC SYSTEM CONTROLS

Heating and cooling systems of the Sherwood Middle School shall be monitored and controlled by an Energy Management System (EMS) using Direct Digital Control (DDC) technology. Each system is monitored for conformance to spatial design conditions and design point settings are adjustable through the DDC system. The DDC system is based on PC architecture with the central monitoring and control station located adjacent to the boiler room. System shall be web based and accessible via password protection through internet browser software.

The HVAC systems are generally operated on a school day basis coinciding with the occupied/unoccupied schedule of the standard 180-day school year. Adjustments can be made through the DDC system to allow for usage during periods other than the usual school operating periods.

Space temperature is monitored by individual space sensors that transmit data to the central monitoring and control station. Space conditions are adjustable through DDC system and can be modified to meet individual needs. Local control of space conditions is limited to predefined adjustments in space temperature and to facilitate a 3-hour occupied override feature.

Several systems shall also include carbon dioxide (CO₂) indoor air quality (IAQ) sensors which optimize the fresh outdoor air ventilation levels in response to variations in space occupancies.

The building shall be connected to an emergency power source for operation of heating boilers and pumps during emergency conditions.

D. SYSTEMS AND EQUIPMENT CAPABILITIES

The heating needs of the school shall be provided for by three (3) high efficiency condensing gas-fired hot water boilers with a combined gross input capacity of 4,500,000 BTUH and an average combustion efficiency of 93%.

High efficiency packaged roof-top units provide treated outdoor air to each classroom space utilizing total energy recovery energy exchange and hot water heating coils. In addition each system incorporates a dehumidification cycle utilizing refrigeration cycle based dehumidification with hot gas coil reheating to minimize classroom high limit humidity levels.

Systems and there capacities are as follows:

Abbreviations:

H&V – Heating & Ventilation; HVAC – Heating, ventilation and air conditioning; ERV – Energy Recovery Ventilation; VAV- Variable Air Volume

- AHU-1: Kitchen Make-up Air, 6,000 CFM
- AHU-2: Café, 6,000 CFM, H&V with ERU & CO₂ control
- AHU-3: Gymnasium, 12,000 CFM, H&V with CO₂ control
- AHU-4: Lobbies, 8,000 CFM, H&V
- RTU-1 Art Rooms, 1,900 CFM VAV, H&V with ERV and Dehum. Control
- RTU-2 Media & Tech., 8,000 CFM VAV, HVAC with ERV
- RTU-3 Office, 8,000 CFM VAV, HVAC with ERV
- RTU-4 Classrooms, 4,100 CFM VAV, H&V with ERV and Dehum. Control
- RTU-5 Classrooms, 3,000 CFM VAV, H&V with ERV and Dehum. Control

- RTU-6 Classrooms, 6,300 CFM VAV, H&V with ERV and Dehum. Control
- RTU-7 Classrooms, 5,400 CFM VAV, H&V with ERV and Dehum. Control
- RTU-8 Band, 810 CFM, H&V with ERV and Dehum. Control
- RTU-9 Music/Drama, 945 CFM VAV, H&V with ERV and Dehum. Control
- RTU-10 Locker Room 2,400 CFM, H&V with ERV
- RTU-11 Core Restrooms, 2,700 CFM, H&V with ERV

Supplemental cabinet and unit heaters are located at building entrances and other areas to mitigate drafts from entering internal building spaces.

E. TESTING

The HVAC equipment and systems are required to be tested and reports submitted for review and record as part of the construction document requirements. In addition, systems shall be properly commissioned by an independent 3rd party. Systems and equipment requiring testing and report submittal are:

- a. Heating system includes all boilers, pumps, and heating coils of connected equipment.
- b. Cooling system including DX split systems and packaged rooftop units.
- c. All piped distribution systems are required to pass a hydrostatic test using water as the pressure medium at a test pressure of 150 percent of operation pressure. All hydronic heating and cooling systems will be tested and balanced. A testing, adjusting, and balancing (TAB) report will be prepared for each system and submitted for review and record to the architect and engineer. TAB shall be done by an independent testing and balancing contractor
- d. All airside components of the HVAC systems shall operate as designed and conform to the specifications for airflow as defined in the contract documents. A testing, adjusting, and balancing (TAB) report will be prepared for each system and submitted for review and record to the architect and engineer. TAB shall be done by an independent testing and balancing contractor.
- e. Ductwork shall be tested for leak integrity and performed in accordance with SMACNA standards.
- f. Systems or equivalent components not meeting the design criteria of the contract documents shall be corrected and re-tested for conformance to contract documents at no additional cost to the owner.
- g. Visual inspection of all equipment installations for conformance to contract documents with respect to sound, vibration and installation integrity. Manufacturers' recommendations for equipment installation will be followed. All HVAC systems will operate in accordance with the sequence of operation defined for that system.

III. DESIGN PARAMETERS & LOADS

DESIGN CRITERIA

The design criteria used for the development and sizing of the HVAC systems and components was as defined in the Commonwealth of Massachusetts State Building Code 780 CMR and applicably referenced ICC International Mechanical Code 2006. Outdoor design conditions utilize were:

Heating Degrees Winter:	-1°F
Cooling Degrees (db) Summer:	86°F
Cooling Degrees (wb) Summer:	73°F

Interior design temperature set points are 72°F for heating and 75°F for cooling (for spaces with cooling) during occupied conditions. Indoor dehumidification setpoint for classroom spaces was set at 55%.

Outside air ventilation requirements were based on the ICC International Mechanical Code 2006 as referenced by the building code as well as cross references to ASHRAE Ventilation Standard 62.1-2007. In general design outdoor air levels of 20 cfm per person for office type occupancy and 15 CFM per person in classroom spaces was utilized.

COOLING & HEATING LOADS

Cooling and heating load calculations were performed utilizing the design data referenced above. Climate data for Worcester, MA was selected for load and energy calculations in that it offers the most applicable environmental conditions to Shrewsbury, MA in addition to the fact that Worcester was the closest city in which pertinent hourly weather data was available for the computer simulation. Summary output data can be found in Appendix C.

The building heating and cooling load requirements under peak design load conditions as indicated above are estimated as follows (cooling loads only for Offices and Media):

	Heating Load	Cooling Load	Tons
Building Loads	3,132,000 BTUH	470,300 BTUH	39.2

The estimates do not include localized cooling loads for tel/data rooms as well as additional heating loads for some area such as vestibules, boiler room, mechanical room and small ancillary spaces.

IV. ENERGY SIMULATIONS

Multiple energy simulations were run for each of the proposed options. The final recommended Option #2 outputs can be found in Appendix D. Data on the passive solar wall system was supplied by the manufacturer and can also be found in Appendix D.

There are various limitations to energy simulation programs especially in a building such as this where occupant loads can vary greatly day to day and space to space. We have listed some of our assumptions below, some of which may have been forced by program modeling limitations.

Assumptions:

- Occupancy times are from 7:00 AM to 4:00 PM Monday thru Friday with varying loading.
- Partial occupancy was assumed for most time periods in the gymnasium space
- Indoor space temperature setpoints are 75°F/88°F occ/unocc cooling (in areas where cooling is supplied and 72°/60° occ/unocc heating.
- Indoor space humidity dehumidification setpoint for classroom spaces is 55% RH.
- Natural gas cost @ \$1.50 per therm
- Electric rate cost @ \$0.14 per kW

V. COST ESTIMATES

Order of magnitude cost estimates for the selected schematic Option #2 were assembled utilizing the schematic estimates from A.M. Fogarty & Associates, Inc. amended as required based on known equipment prices from vendors. In addition, we projected estimates for the base case and Option #1 utilizing RS Means Cost Data and current knowledge of system pricing. Estimate for the passive Solar Wall was provided by the Solar Wall manufacturer. Refer to Solar wall data in Appendix D.

A summary of the installed cost estimates are as follows:

- **Base Case – Classroom Unit Ventilators:** → **\$3,335,100**
- **Option #1 – Classroom Radiation & ERU's:** → **\$3,386,000**
- **Option #2 – Classroom Radiation & ERU w/ Dehum.:** → **\$3,452,000**
- **Alternate #1 – Solar Wall.:** → **\$52,850**

Appendix B

Proposed Equipment Data

RN Series

PACKAGED ROOFTOP UNITS, HEAT PUMPS & OUTDOOR AIR HANDLERS

Features:

- Air-cooled or water-cooled condenser, with unit capacities from 6-70 Tons
- Available as a chilled water or non-compressorized DX air handler, from 1,400-28,500 CFM
- Air-source and water-source heat pump options
- R-410A scroll compressors, one, two or four stage cooling
- 10-100% variable capacity scroll compressors are available for load matching cooling and increased part load efficiency
- Electric, gas, steam, or hot water heating
- Direct drive backward curved plenum supply fans
- Power exhaust and power return options
- Factory installed AAONAIRE® total and sensible energy recovery wheels
- Double wall rigid polyurethane foam panel construction with a minimum R-value of 13
- Service access doors with full length stainless steel piano hinges and zinc cast lockable handles
- Sloped stainless steel drain pans

Application Flexibility
Minimizes Installation Time and Reduces Cost

○ *Make-up Air Applications
Up to 100% Outside Air*

○ *Dehumidification and
Filtration Capabilities*

○ *Large Tonnage Rooftops
with Small Footprints*

○ *Factory Installed or Customer
Specific Controls Options*

RN Series

Rooftop/Air Handler

The AAON RN Series continues to lead the industry in packaged rooftop equipment performance and serviceability. Double wall foam insulated cabinet construction and direct drive backward curved plenum fans allow the units to have quiet, energy efficient airflow with high static pressure capabilities. RN Series units also feature lockable hinged doors which provide service access to all sections of the unit.

B Cabinet

Superior Features

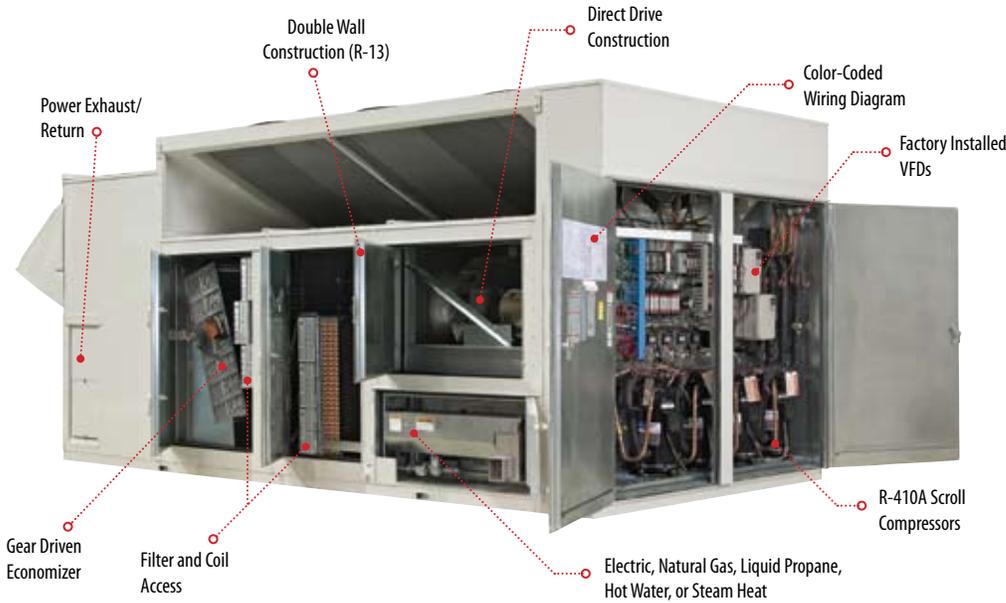

- R-410A environmentally friendly refrigerant.
- Cabinet construction consists of rigid polyurethane foam panels with G90 galvanized steel on both sides and a closed cell polyurethane foam interior core. The inner wall protects the insulation from moisture damage, prevents microbial growth, and is easy to clean.
- 2 inch rigid polyurethane foam insulated panels have at least a thermal resistance R-value of 13, which exceeds the R-value of a cabinet with 4 inch thick fiberglass construction. They also make the cabinet more rigid and resistant to damage and provide increased sound dampening.
- Access doors with full length stainless steel piano hinges and quarter turn, zinc cast, lockable handles provide improved reliability over single point hinges and plastic or sheet metal handles, and make the unit easily serviceable.
- Corrosion resistant polyurethane paint exceeds a 2,500 hour salt spray test - over 5 times the industry standard of 500 hours.
- Compressors and unit controls are contained within a compartment isolated from the air stream for ease of service and increased sound dampening.
- Direct drive backward curved plenum fans with rubber isolation mounts provide improved energy efficiency and reduced maintenance versus belt driven fans.
- Sloped stainless steel drain pans eliminate standing water which can support microbial growth and stainless steel construction prevents corrosion that could lead to water leaks and contaminants in the air stream.
- Run test report, wiring diagram, and Installation, Operation, and Maintenance manual with startup form provided in control access compartment of every unit.
- 5 year non-prorated compressor warranty, 15 year non-prorated aluminized steel gas heat exchanger warranty, and 25 year non-prorated stainless steel gas heat exchanger warranty.

Premier Options

- 10-100% variable capacity scroll compressors are available for load matching cooling and increased part load efficiency.
- Refrigerant-to-water heat exchanger for improved unit efficiency.
- Air-source and water-source heat pump options for energy efficient heating.
- Factory installed total or sensible AAONAIR® energy recovery wheels.
- Humidity control options including: High Capacity Coils, Modulating Humidity Control, Return Air Bypass, and Mixed Air Bypass.
- Chilled water cooling coils allow unit to tie into existing chilled water system.
- Hot water or steam heating coils allow unit to tie into existing boiler system.
- Polymer e-coated coils, copper finned coils, and stainless steel coil casings are available to extend the life of the coils and protect them in corrosive environments.
- Power exhaust and power return fans with economizer for application flexibility.
- VFD controlled supply, exhaust, and return fans for precise airflow control, building pressure control, and reduced power consumption.
- Modulating gas heat with stainless steel heat exchanger provides greater fuel efficiency, longer heater life, and improved occupancy comfort.
- SCR (Silicon Controlled Rectifier) electric heat control for reduced power consumption, longer heater life, and improved occupant comfort.
- Multiple high efficiency air filtration options.
- Unit controls options including factory installed controls by others.

Air-Cooled or Water-Cooled Condensers

D Cabinet

R-13 Double Wall Rigid Polyurethane Foam Panel Construction

AAON is setting a new standard for performance with double wall construction using closed cell polyurethane foam insulation. Not only does it have more than twice the insulating R-value, it creates a far more rigid and stronger assembly with less air leakage than fiberglass insulated panels.

Dehumidification

AAON offers many humidity control options. High capacity cooling coils are available which allow for more dehumidification versus standard cooling coils. Return air bypass and mixed air bypass are available on RN Series units for single coil humidity control. Modulating humidity control is available to provide energy efficient dehumidification, even with low sensible heat loads, without the temperature swings common with on/off reheat systems.

Make Up Air Capability

AAON RN Series units have make up air capability and can be specified with up to 100% outside air. AAONAIR® energy recovery wheels are available on make up air units to increase the unit's energy efficiency. High capacity cooling coils are available to handle the higher latent load of outside air. Modulating gas heat and SCR electric heat are available to provide energy efficient, consistent supply air temperature heating. Modulating humidity control is available to provide dehumidification without overcooling when the outside air humidity is above setpoint. Variable capacity scroll compressors are available to provide energy efficient consistent supply air temperature cooling.

Air Handler Option

AAON RN Series outdoor air handlers provide a hydronic cooling and heating option in the RN Series unit size. Gas, electric, steam, and hot water heating are available on an RN Series outdoor air handler. Cabinet construction is similar to the RN Series packaged rooftop units with easily accessible coil connections.

RN Model	Cabinet	Air-Cooled EER	Water-Cooled EER	Nominal CFM	Width	Length*	Height*
006	A	Up to 14.0	Up to 18.4	2,400	79	82	44

Rooftop / Air Handler

AAON Environmentally Friendly HVAC Product Family

Customer Commitment – AAON encourages environmentally responsible design by incorporating many energy saving features into our superior heating and cooling products. In addition to energy efficiency, AAON also offers environmentally friendly R-410A refrigerant capability in all our cooling and heat pump equipment. As countries throughout the world phase out CFC and HCFC refrigerants, R-410A is becoming the global standard and AAON is leading the way!

REVOLUTIONARY MODULAR HOT WATER BOILER DESIGN FROM CLEAVER-BROOKS

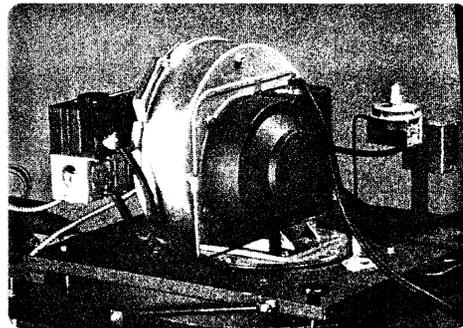

CLEARFIRE

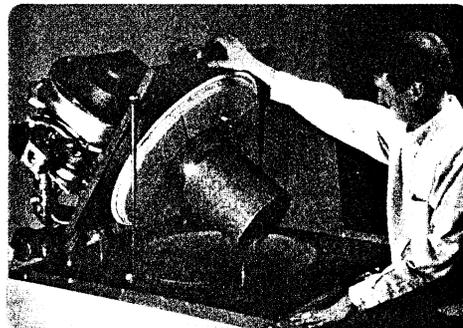

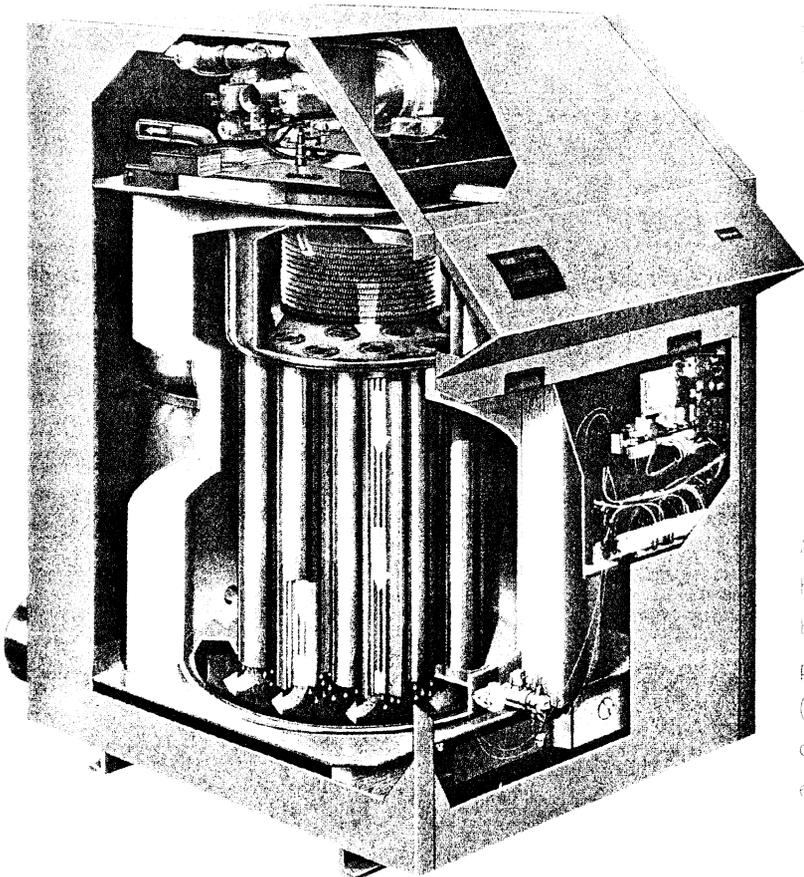

DESIGNED TO MEET THE DEMANDS OF TODAY'S ENVIRONMENT AND TOMORROW'S MARKET NEEDS

For more information, visit us at www.cleaver-brooks.com

The burner on the GEA 1000 Series is designed to deliver the highest efficiency and lowest emissions while maintaining a "whisper quiet" operation at full output. The secret is a combination of engineering and precise machining. Because the burner adjusts its speed based on water temperature, the burner's design feature allows the burner to operate at 10% to 20% efficiency savings, therefore, reducing the amount of cycling losses caused by temperature fluctuations.

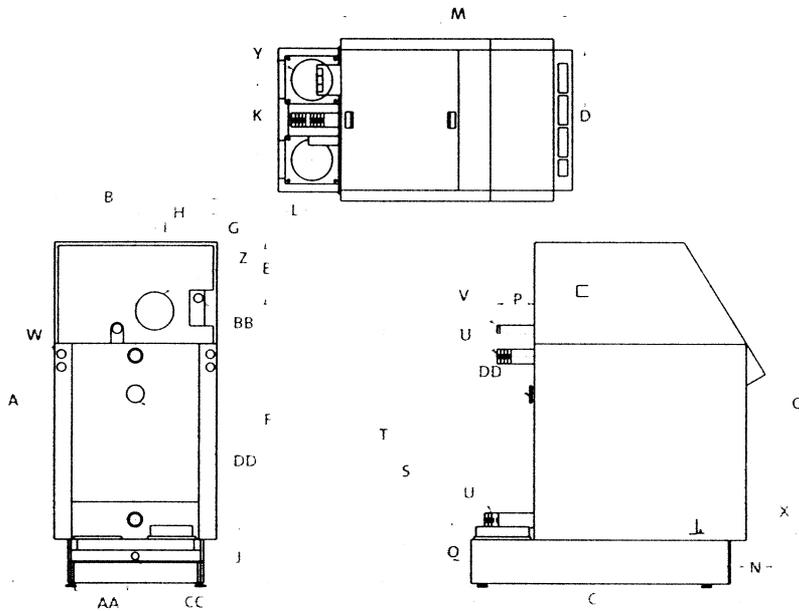

The controller is the GEA 1000 Series's control system including a gas control valve, a pressure switch, a spark igniter, a flame sensor, and a full annunciator display. The controller coordinates a sequence of events to start the burner for larger demands. The burner is divided into two separate parts, a burner head and burner body, based on the burner's size. The burner body and operation are controlled by the burner head.

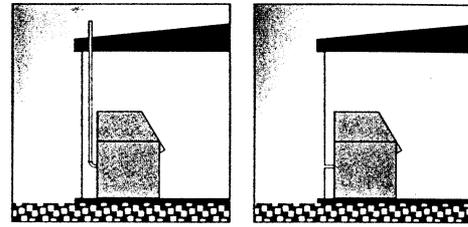

Maintenance is made easier by the burner assembly being hinged to the burner body. The burner head reveals the burner components, allowing the burner to be inspected properly. The burner head is mounted on a platform (hinged and tilted) that allows the operator or service technician to perform maintenance to most easily work.

Our Skill And Strength Turns Fire Into Power!

A Cleaver-Brooks Company

www.cleaver-brooks.com

HIGH COMBUSTION EFFICIENCY AND LOW EMISSIONS

The *Clearfire* FeCrAlloy metal fiber burner has been specifically designed to premix the air and fuel to achieve a precise ratio resulting in optimum combustion efficiency. The result is an almost flameless combustion of the homogenous gas/air mixture. The solid body radiation of the burner's surface cools the flame allowing extremely low emissions with NOx levels to sub 10 ppm. The FeCrAlloy metal fiber body is also flexible, preventing thermal stresses, resulting in extended life.

The high thermal efficiency of the *Clearfire* boiler/burner package results from a combination of the burner and boiler working together to maximize heat transfer. One of the key reasons for full condensing and 98% total water efficiency are the tubes used in the *Clearfire*. The tube itself is constructed of stainless steel to which complex aluminum fins are attached to the outside, allowing the boiler to store capability up to 10 times that of a standard boiler. This unique design also provides a high gas velocity and turbulent flow which further facilitates heat transfer, keeping the fireside clean and efficient.

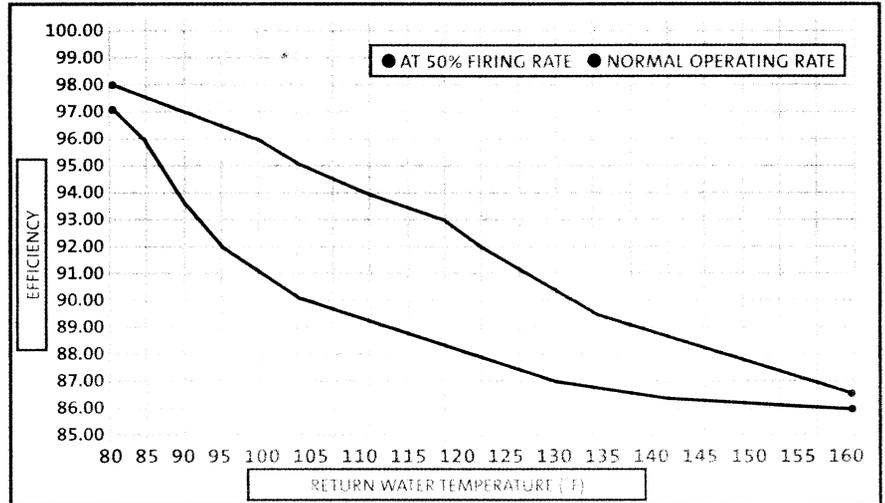

CLEARFIRE

CLEARFIRE'S HIGH PERFORMANCE STANDARD

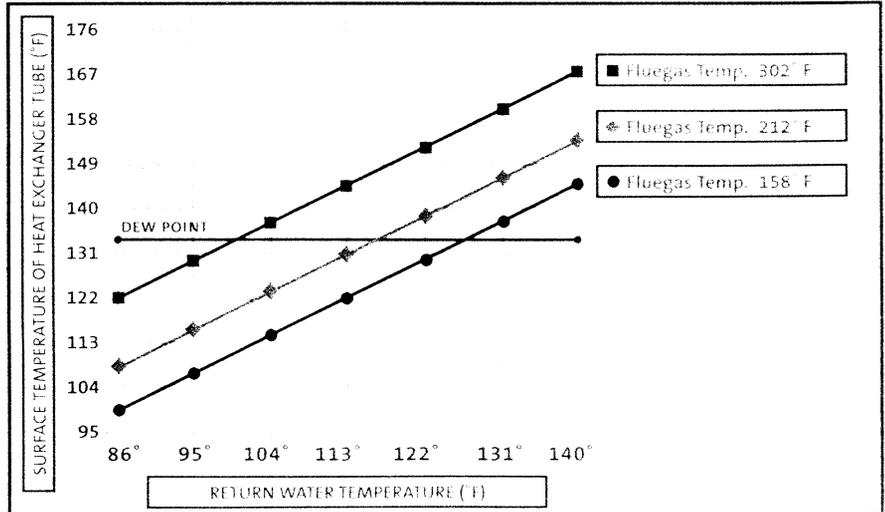

The *Clearfire*, with a range of sizes to meet almost any commercial application, combines engineering expertise with ISO 9001 quality standards to deliver a product unsurpassed in the industry when it comes to peak performance and low environmental impact. When deciding on your next heating boiler to specify or buy, consider these ten *Clearfire* advantages:

- Modular boiler design offering sizes from 750 – 1800 MBH
- Rugged stainless steel construction with 20 year thermal shock guarantee
- Ultra high performance (full condensing) with efficiencies to 98%
- Fully modulating burner with variable speed fan
- "Whisper" quiet operation with a decibel rating of <70 dB at high fire
- Low emissions; NOx levels to sub 10 ppm
- Sealed combustion capability
- No minimum flow or water temperature requirements
- Low waterside pressure drop
- Fully backed by Cleaver-Brooks Authorized Sales and Service Network

Air System Sizing Summary for OFFICES

Project Name: Sherwood Middle School OPTION #2
 Prepared by: Johnson & Seaman Engineering

12/09/2009
 06:43AM

Air System Information

Air System Name	OFFICES	Number of zones	16
Equipment Class	PKG ROOF	Floor Area	7692.0 ft ²
Air System Type	VAV	Location	Worcester, Massachusetts

Sizing Calculation Information

Zone and Space Sizing Method:		Calculation Months	Jan to Dec
Zone CFM	Peak zone sensible load	Sizing Data	Calculated
Space CFM	Individual peak space loads		

Central Cooling Coil Sizing Data

Total coil load	18.3	Tons	Load occurs at	Jul 1600
Total coil load	220.1	MBH	OA DB / WB	85.5 / 72.9 °F
Sensible coil load	161.1	MBH	Entering DB / WB	79.5 / 65.0 °F
Coil CFM at Jul 1600	5773	CFM	Leaving DB / WB	52.7 / 51.5 °F
Max block CFM at Jul 1600	6474	CFM	Coil ADP	49.8 °F
Sum of peak zone CFM	6570	CFM	Bypass Factor	0.100
Sensible heat ratio	0.732		Resulting RH	48 %
ft ² /Ton	419.3		Design supply temp.	55.0 °F
BTU/(hr-ft ²)	28.6		Zone T-stat Check	16 of 16 OK
Water flow @ 10.0 °F rise	N/A		Max zone temperature deviation	0.0 °F

Preheat Coil Sizing Data

Max coil load	0.9	MBH	Load occurs at	Des Htg
Coil CFM at Des Htg	1920	CFM	Ent. DB / Lvg DB	49.6 / 50.0 °F
Max coil CFM	6474	CFM		
Water flow @ 20.0 °F drop	0.09	gpm		

Supply Fan Sizing Data

Actual max CFM at Jul 1600	6474	CFM	Fan motor BHP	7.11 BHP
Standard CFM	6242	CFM	Fan motor kW	5.30 kW
Actual max CFM/ft ²	0.84	CFM/ft ²	Fan static	3.00 in wg

Return Fan Sizing Data

Actual max CFM at Jul 1600	6474	CFM	Fan motor BHP	7.11 BHP
Standard CFM	6242	CFM	Fan motor kW	5.30 kW
Actual max CFM/ft ²	0.84	CFM/ft ²	Fan static	3.00 in wg

Outdoor Ventilation Air Data

Design airflow CFM	1920	CFM	CFM/person	15.00 CFM/person
CFM/ft ²	0.25	CFM/ft ²

Energy Analysis Data

Annual Cost Summary

Sherwood Middle School
Johnson & Seaman Engineering

12/08/2009
11:41AM

Table 1. Annual Costs

Component	Sherwood Option #2 (\$)
Air System Fans	22,761
Cooling	5,235
Heating	29,822
Pumps	3,386
Cooling Tower Fans	0
HVAC Sub-Total	61,205
Lights	35,631
Electric Equipment	22,051
Misc. Electric	0
Misc. Fuel Use	0
Non-HVAC Sub-Total	57,683
Grand Total	118,888

Table 2. Annual Cost per Unit Floor Area

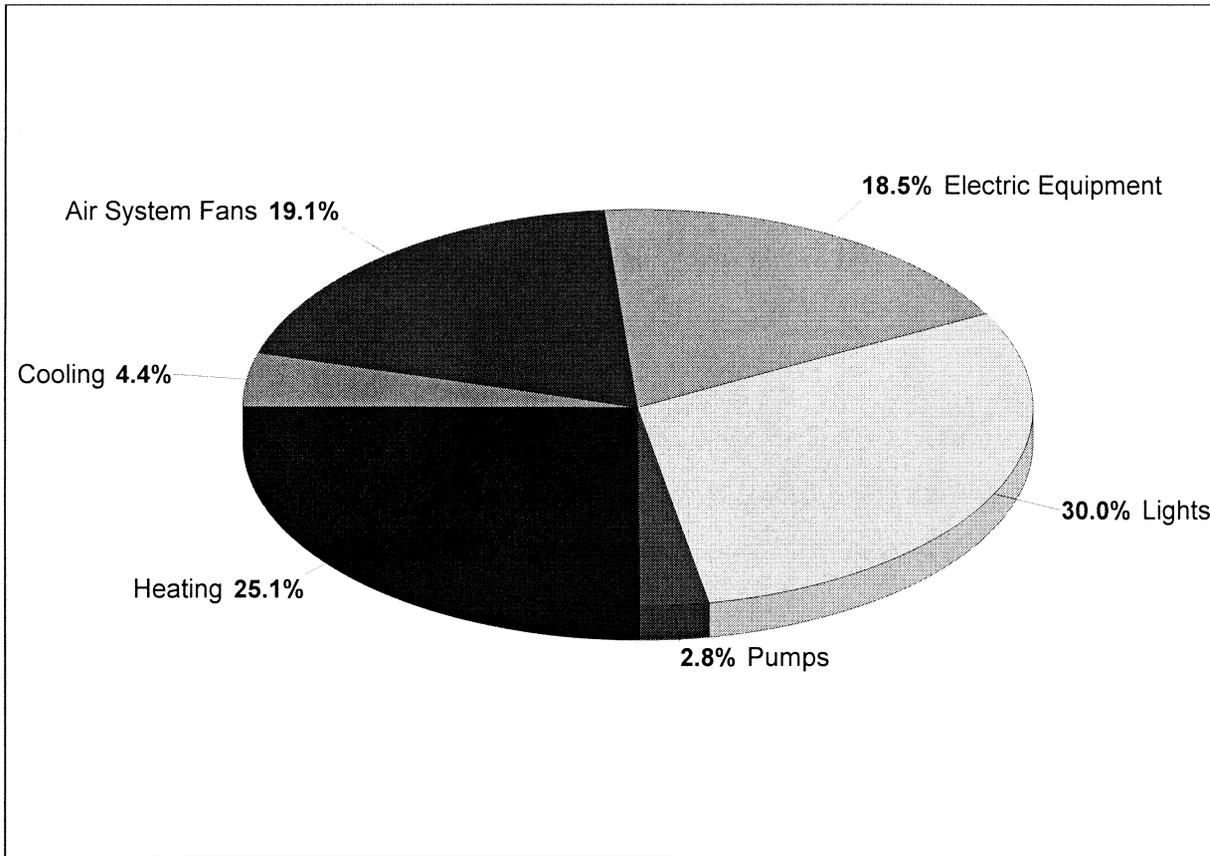

Component	Sherwood Option #2 (\$/ft ²)
Air System Fans	0.221
Cooling	0.051
Heating	0.289
Pumps	0.033
Cooling Tower Fans	0.000
HVAC Sub-Total	0.593
Lights	0.345
Electric Equipment	0.214
Misc. Electric	0.000
Misc. Fuel Use	0.000
Non-HVAC Sub-Total	0.559
Grand Total	1.153
Gross Floor Area (ft ²)	103155.0
Conditioned Floor Area (ft ²)	103155.0

Note: Values in this table are calculated using the Gross Floor Area.

Table 3. Component Cost as a Percentage of Total Cost

Component	Sherwood Option #2 (%)
Air System Fans	19.1
Cooling	4.4
Heating	25.1
Pumps	2.8
Cooling Tower Fans	0.0
HVAC Sub-Total	51.5
Lights	30.0
Electric Equipment	18.5
Misc. Electric	0.0
Misc. Fuel Use	0.0
Non-HVAC Sub-Total	48.5
Grand Total	100.0

Annual Component Costs - Sherwood Option #2

1. Annual Costs

Component	Annual Cost (\$)	(\$/ft ²)	Percent of Total (%)
Air System Fans	22,761	0.221	19.1
Cooling	5,235	0.051	4.4
Heating	29,822	0.289	25.1
Pumps	3,386	0.033	2.8
Cooling Tower Fans	0	0.000	0.0
HVAC Sub-Total	61,205	0.593	51.5
Lights	35,631	0.345	30.0
Electric Equipment	22,051	0.214	18.5
Misc. Electric	0	0.000	0.0
Misc. Fuel Use	0	0.000	0.0
Non-HVAC Sub-Total	57,683	0.559	48.5
Grand Total	118,888	1.153	100.0

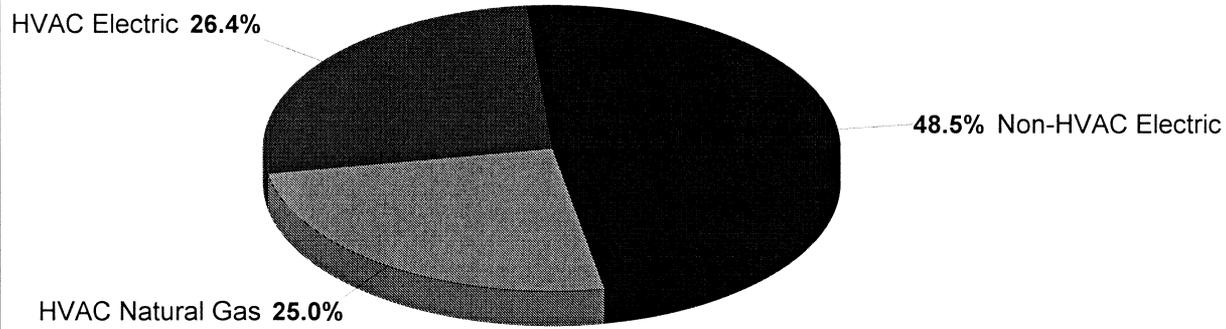

Note: Cost per unit floor area is based on the gross building floor area.

Gross Floor Area 103155.0 ft²
 Conditioned Floor Area 103155.0 ft²

Annual Energy Costs - Sherwood Option #2

Sherwood Middle School
Johnson & Seaman Engineering

12/08/2009
11:41AM

1. Annual Costs

Component	Annual Cost (\$/yr)	(\$/ft ²)	Percent of Total (%)
HVAC Components			
Electric	31,430	0.305	26.4
Natural Gas	29,774	0.289	25.0
Fuel Oil	0	0.000	0.0
Propane	0	0.000	0.0
Remote Hot Water	0	0.000	0.0
Remote Steam	0	0.000	0.0
Remote Chilled Water	0	0.000	0.0
HVAC Sub-Total	61,205	0.593	51.5
Non-HVAC Components			
Electric	57,682	0.559	48.5
Natural Gas	0	0.000	0.0
Fuel Oil	0	0.000	0.0
Propane	0	0.000	0.0
Remote Hot Water	0	0.000	0.0
Remote Steam	0	0.000	0.0
Non-HVAC Sub-Total	57,682	0.559	48.5
Grand Total	118,886	1.153	100.0

Note: Cost per unit floor area is based on the gross building floor area.

Gross Floor Area 103155.0 ft²
 Conditioned Floor Area 103155.0 ft²

Energy Budget by System Component - Sherwood Option #2

Sherwood Middle School
Johnson & Seaman Engineering

12/08/2009
11:41AM

1. Annual Coil Loads

Component	Load (kBTU)	(kBTU/ft ²)
Cooling Coil Loads	986,993	9.568
Heating Coil Loads	2,263,906	21.947
Grand Total	3,250,898	31.515

2. Energy Consumption by System Component

Component	Site Energy (kBTU)	Site Energy (kBTU/ft ²)	Source Energy (kBTU)	Source Energy (kBTU/ft ²)
Air System Fans	554,726	5.378	1,981,165	19.206
Cooling	127,592	1.237	455,687	4.418
Heating	2,288,889	22.189	2,291,875	22.218
Pumps	82,526	0.800	294,735	2.857
Cooling Towers	0	0.000	0	0.000
HVAC Sub-Total	3,053,734	29.603	5,023,462	48.698
Lights	868,389	8.418	3,101,389	30.065
Electric Equipment	537,424	5.210	1,919,373	18.607
Misc. Electric	0	0.000	0	0.000
Misc. Fuel Use	0	0.000	0	0.000
Non-HVAC Sub-Total	1,405,813	13.628	5,020,761	48.672
Grand Total	4,459,547	43.232	10,044,223	97.370

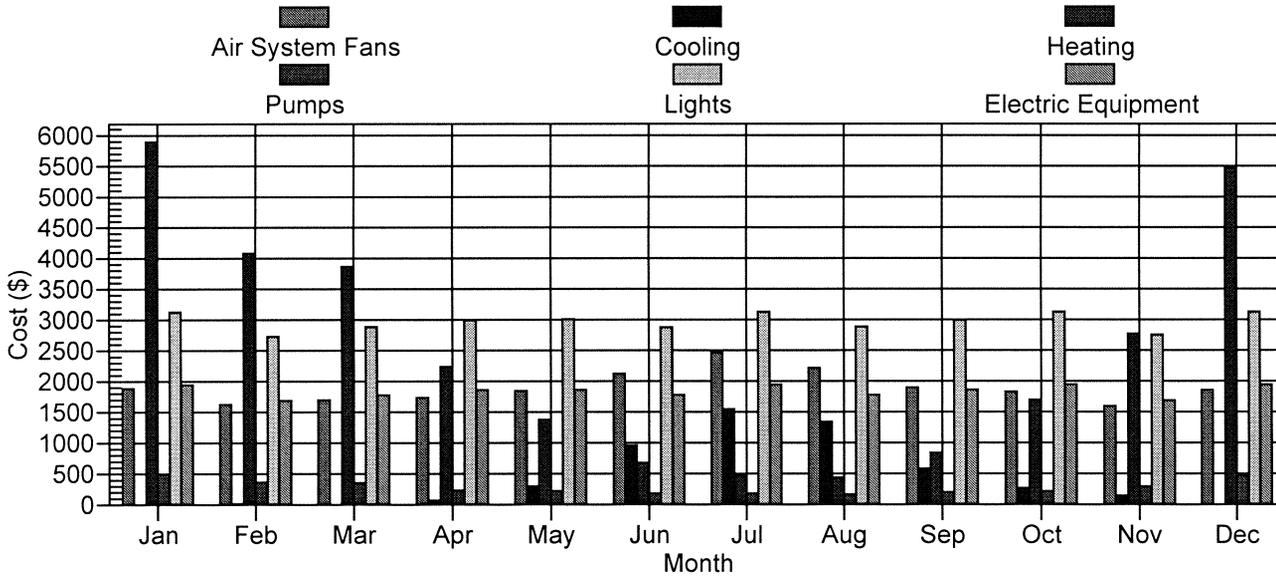

Notes:

1. 'Cooling Coil Loads' is the sum of all air system cooling coil loads.
2. 'Heating Coil Loads' is the sum of all air system heating coil loads.
3. Site Energy is the actual energy consumed.
4. Source Energy is the site energy divided by the electric generating efficiency (28.0%).
5. Source Energy for fuels equals the site energy value.
6. Energy per unit floor area is based on the gross building floor area.
 Gross Floor Area **103155.0** ft²
 Conditioned Floor Area **103155.0** ft²

NRCan/CETC - Varennes

November 18, 2009

Jerimey Moran
Seaman Engineers

I have attached the Sherwood Middle School Energy model for you to review based on the information provided. I sized the SolarWall @ 3,000ft² with a cfm rate of 4.3/ft².

- Engineering cost - \$3,000 - approximate
- Shipping - \$2,000 - you would be billed actual

- Installation - it varies from region to region I used \$6 sq ft any reputable sheet metal install can do the install
- SolarWall System - includes 26gauge panels, framing, fasteners, flats {25% of panel area}, foam closures \$9.95 sq ft

- I did not include fans, controls or ducting – usually the local HVAC has brands that they both service and sell –

- Average Temperature Rise – 14.6 Degrees Fahrenheit

- Greenhouse Gas [GHG] Emission Reduction 34.2 tonsCO₂/year

- Annual Fuel Savings –Total - \$8,687

- Positive cash flow payback 5.2 years - this factors in the expected 5% escalation of energy over the 30 yr life of the project - it is more accurate than the simple payback of 6.1 years

- If the feasibility of the SolarWall meets your financial parameters our engineer TJ Johnson would need:
 1. Picture of the building
 2. Elevation and section views
 3. Where the proposed wall would be installed
 4. Dimensions to scale w/ reference
 5. Structure material of building wall

Respectfully submitted,

John F. Hickey

Sherwood Middle School

Sherwood Avenue, Shrewsbury, Massachusetts

Schematic Design - Electrical Systems Narrative

November 23, 2009

ELECTRICAL SERVICE

The electrical service to the building will be 1600A, 277Y/480V, 3-phase, 4-wire electrical switchboards with ground fault protection, digital metering and TVSS located in the main electrical room. The digital metering system at the main switchboards will be capable of providing electrical consumption data at least daily and measured at 15 minute intervals. The new service will be underground and fed from new utility company padmount transformer located on the exterior of the building. The conductors for each electrical service will be 4 sets of 4-600 KCMIL in 4-4 in. conduits from the utility company padmount transformer to the switchboard. The grounding electrode system will be designed to have resistance of 5 ohms or less.

ELECTRICAL DISTRIBUTION

The electrical distribution will include new panelboards and feeders. The following distribution panels will be provided:

Main Electric Room

- (1) 1600A, 277Y/480V, 3-Phase, 4-Wire, Switchboard
- (2) 200A, 277Y/480V, 3-Phase, 4-Wire, 42-circuit panelboard
- (2) 75kVA 480V to 120Y/208V, step-down transformers
- (1) 225A, 120Y/208V, 3-Phase, 4-Wire, 84-circuit panelboard
- (1) 225A, 120Y/208V, 3-Phase, 4-Wire, self-enclosed circuit breaker
- (1) 45kVA 480V to 120Y/208V, K-13, step-down transformer with 200% neutral lugs
- (1) 150A, 120Y/208V, 3-Phase, 4-Wire, 84-circuit panelboard with 200% neutral
- (1) 200A, 277Y/480V, automatic transfer switch (Standby Power Branch)
- (1) 175A, 277Y/480V, 3-Phase, 4-Wire, 42-circuit panelboard (Standby Power Branch)
- (1) 15kVA 480V to 120Y/208V, step-down transformers (Standby Power Branch)
- (1) 60A, 120Y/208V, 3-Phase, 4-Wire, 30-circuit panelboard (Standby Power Branch)
- (1) 16 circuit lighting control panel

Telecom Server Room

- (1) 125A, 120Y/208V, 3-Phase, 4-Wire, 42-circuit panelboard with TVSS and 200% neutral

Kitchen

- (1) 225A, 120Y/208V, 3-Phase, 4-Wire, 84-circuit panelboard

First Floor Electric Room

- (1) 100A, 277Y/480V, 3-Phase, 4-Wire, 42-circuit panelboard
- (1) 45kVA 480V to 120Y/208V, K-13, step-down transformer with 200% neutral lugs
- (1) 150A, 120Y/208V, 3-Phase, 4-Wire, 84-circuit panelboard with 200% neutral
- (1) 30kVA, 480 to 120Y/208V UPS
- (1) 16 circuit lighting control panel

Second Floor Electric Room

- (1) 200A, 277Y/480V, 3-Phase, 4-Wire, 42-circuit panelboard
- (2) 45kVA 480V to 120Y/208V, K-13, step-down transformer with 200% neutral lugs
- (2) 150A, 120Y/208V, 3-Phase, 4-Wire, 84-circuit panelboard with 200% neutral
- (1) 16 circuit lighting control panel

Third Floor Electric Room

- (1) 200A, 277Y/480V, 3-Phase, 4-Wire, 42-circuit panelboard
- (2) 45kVA 480V to 120Y/208V, K-13, step-down transformer with 200% neutral lugs
- (2) 150A, 120Y/208V, 3-Phase, 4-Wire, 84-circuit panelboard with 200% neutral
- (1) 16 circuit lighting control panel

EMERGENCY/STANDBY POWER

The emergency/standby power for the building will be provided by a 150kW/187.5kVA generator. The generator will be located on the exterior of the building and will have a base-mounted integral fuel oil tank. The generator will feed the emergency (life safety branch) distribution with one (1) 100A-3P circuit breaker and the standby distribution with one (1) 175A-3P circuit breaker. The emergency power transfer, distribution equipment and feeders will be 2-hour rated. The emergency electrical distribution will include new panelboards and feeders located in new 2-hour rated emergency electrical room and closets. The following distribution panels will be provided:

Emergency Electric Room (Life Safety Branch)

- (1) 100A, 277Y/480V, automatic transfer switch
- (1) 100A, 277Y/480V, 3-Phase, 4-Wire, 42-circuit panelboard
- (1) 15kVA 480V to 120Y/208V, step-down transformers
- (1) 60A, 120Y/208V, 3-Phase, 4-Wire, 30-circuit panelboard

First Floor Emergency Electric Closet (Life Safety Branch)

- (1) 100A, 277Y/480V, 3-Phase, 4-Wire, 42-circuit panelboard

GENERAL PURPOSE POWER

Classrooms: A minimum of two double duplex receptacles will be provided on two walls for teacher stations; one double duplex will be provided for a student computer station; two GFCI duplex receptacles will be provided for the counter; one duplex receptacle will be mounted 96" AFF on two walls for interactive whiteboard and wireless access points; and two TVSS duplex receptacles will be provided in every other classroom for laptop charger carts.

A minimum of one general purpose 120V, 20A duplex receptacle will be provided in utility and storage rooms. A minimum of one general purpose receptacle will be provided on each wall in offices, conference rooms, etc. where walls exceed 12 feet, an additional duplex receptacle for each additional 12 feet of wall or fraction thereof will be provided. A minimum one general purpose receptacle will be provided every 50 ft. in hallways.

Each stand-alone, non-system furniture workstation will be provided with an adjacent double duplex receptacle on an independent single phase, 120V, 20A clean power circuit having not more than four duplex receptacles and a non-shared neutral. Each stand-alone, system furniture workstation will be provided with an adjacent double-duplex receptacle on an independent single phase, 120V, 20A clean power circuit having not more than six duplex

receptacles and a non-shared neutral. Each group of six (6) (or fraction thereof) modular, system furniture workstations will be provided with a five (5) wire furniture feed consisting of three isolated ground independent, single phase, 120V, 20A clean power circuits. This multi-wire branch circuit will be served by a three pole circuit breaker that simultaneously disconnects all ungrounded conductors of the multi-wire branch circuit.

Multiple service floor outlets or fire rated poke-thru outlets will be provided for equipment and appliances in the commons areas when the equipment is to be placed on worktables, counters, systems furniture, or cabinets that are not against fixed walls. Multi-outlet raceway will be provided above workbenches with receptacles 12 inches on center where required. Receptacle and power connections for kitchen, gymnasium, etc. will be provided.

INTERIOR LIGHTING SYSTEM

High efficiency lighting will be provided in all interior spaces as well as on the exterior of the building. The light power density in the interior of the building will not exceed 0.7W/sq. ft. Linear direct/indirect fixtures with T5 will be provided; recessed downlight fixture with compact fluorescent or LED lamps will be provided. Interior lighting will be controlled with an automatic control device to shut off building lighting in all spaces. The automatic control device will function on either a scheduled basis using a time of day operated control device that turns lighting off at specific programmed times; or on occupant sensor that will turn lighting off within 30 minutes of an occupant leaving a space; or an unscheduled basis by occupant intervention.

Each space enclosed by ceiling-height partitions will have at least one control device to independently control the general lighting within the space. Each control device will be activated either manually by an occupant or automatically by sensing an occupant. Each perimeter office space enclosed by ceiling-height partitions will have a manual control to allow the occupant to uniformly reduce the connected lighting load by at least 50% or will be provided with automatic day-lighting controls.

Each perimeter classroom space will have a manual control to allow the occupant to uniformly reduce the connected lighting load by at least 50% or will be provided with automatic day-lighting controls. The lighting controls will be integrated with the HVAC controls.

EXTERIOR LIGHTING

Pedestrian walkways will be designed for an average maintained illuminance value of 0.6 footcandle horizontal, and 1.1 footcandle vertical, as measured 6'- 0" above ground, and will maintain an avg/min illuminance uniformity ratio not to exceed 4:1. All parking lots will be designed for a minimum level of 0.2 footcandle at the ground plane, a minimum vertical illuminance of 0.1 footcandle measured 5'-0" above the ground plane and a max/min uniformity ratio of 20:1 Roadways will be designed for an average maintained illuminance value of 0.6 footcandle and will maintain an average/minimum uniformity ratio not exceeding 4:1.

Pedestrian walkway lighting will be LED bollard type fixtures; parking and roadway lighting will be wired or solar powered LED fixtures mounted on 20 ft. poles.

EGRESS & EXIT LIGHTING

Egress lighting will be provided in egress pathways, classrooms, bathrooms, assembly areas and outside each egress door. Exit lighting will be provided in egress pathways and in assembly

areas. Egress and exit lighting will be connected to the life safety branch of the emergency/standby generator.

FIRE ALARM SYSTEM

A new addressable fire alarm system with voice evacuation and connection to the fire department will be provided. The design of the fire alarm system will be based on engineering criteria as defined by NFPA 72-2007 and the Massachusetts State Building Code 780 CMR. The system will be supported by standby batteries. The batteries will support 24-hours of full supervisory operation followed by 15 minutes of alarm. Combination audiovisual signaling appliances will be provided as required per NFPA 72-2007. Standalone devices may be used to augment combination units when necessary. The audiovisual notification appliances will be located in all egress pathways, classrooms, public and common areas. Visual devices will be provided in all offices. The devices will be in compliance with the Americans with Disabilities Act (ADA). Manual pull stations will be located within 5 ft. of each means of egress and mounted at 44 in. above the floor to the activating lever of the box. The pull stations will mechanically latch upon operation and remain so until manually reset by a key common to all system locks. Photoelectric smoke detectors will be located in all egress pathways spaced 30 feet on center, and 15 feet from all stairwells and opposing walls. Smoke detectors will also be located at the top, bottom of each stairway; mechanical equipment; electrical; transformer; telephone equipment; elevator machine; or similar room. Elevator recall smoke detectors will be located in the elevator lobby on each floor. Duct smoke detectors listed for use in the air distribution systems will be located down stream of the air filters and ahead of the branch connections in air systems of greater than 2000-cfm capacity. The sprinkler tamper switches will be connected to the fire alarm control panel and supervised for trouble signal. The sprinkler flow switches will be connected to the fire alarm control panel and wired for alarm.

TELECOMMUNICATIONS CABLING

The telecommunications cabling system will be in compliance with the latest EIA/TIA standards. The utility company services will be terminated in the telecommunications entrance facility (EF). Fire rated plywood backboards, grounding, equipment racks, 110-type punch down blocks, patch panels, conduit sleeves, and corridor cable tray system will be provided in the EF, telecommunications equipment room (TER) and telecommunications rooms (TR). The pathway system, racks and equipment will be sized for complete utilization of the service entrance cables and all voice and data outlets plus room for minimum of 50% growth. Voice and data outlets will be provided in all administration areas and in the classrooms. Voice and data horizontal cabling will be Category 6, unshielded, twisted pair, 8 conductor copper cable from each jack to the nearest telecommunications closet. Each end of each cable will be labeled, the cables will be terminated in accordance with ANSI/TIA/EIA-568-B configuration T568-A, and tested in accordance with ANSI/TIA/EIA- 568-B.

A minimum of two (2) voice/data outlets will be provided in each office; one (2) voice and six (6) data outlets in each classroom; two (2) data outlets in the ceiling in each classroom, one for interactive whiteboard and one for wireless access point; one (1) data outlet in the ceiling on 40' centers in the corridors and in the assembly areas for wireless access points; one (1) data outlet for each computer workstation in the media and computer classrooms.

Backbone cables will be provided between the TER and each TR. Copper backbone cables will be voice grade Category 3 cable. The cables will be tested in accordance with ANSI/TIA/EIA 568-B. Optical fiber cables will be 12-strand multimode laser optimized cable and 12-strand

single mode cable. The cables will be terminated in fiber optic patch panels at both ends. The circuits will be tested for insertion loss at both ends at 1310 and 1550nm. High-resolution Optical Time Domain Reflectivity (OTDR) tests will be performed on each fiber at one end.

CLOCK SYSTEM

A Master Time & Control System will be provided. The system shall comprise a Master Clock that controls and synchronizes the time on peripheral clocks located throughout the school. The system will also control other peripheral devices such as bells, etc. and utilize the school public address system to sound pre-programmed tones for class changes. Clocks will be provided in classrooms, assembly areas and in administration areas.

INTERCOM/PUBLIC ADDRESS SYSTEM

An intercom/public address speakers will be provided. Speakers will be located in classrooms, in administration areas, assembly areas and in public and common areas. The system will provide administrators with the ability to make announcements throughout the school premises, to a limited area, or to an individual classroom. The system will incorporate a 'talkback' feature so that the speakers used for overhead paging in individual areas are also microphones for two-way intercom operations. A telephone handset in each classroom will initiate either a routine or emergency call. In the front office, the administrative staff can select whether they want to initiate or respond to individual 2-way conversations, make announcements, or play background music. The system will be capable of supporting multiple, simultaneous communications.

AUDIO-VIDEO SYSTEMS

A sound system will be provided in the cafeteria and gymnasium. The systems will be integrated with the public address system so that the sound system can either reinforce or be muted when an emergency announcement from the front office is generated. A theatrical sound system will be provided in the auditorium. The sound system will also be integrated with the fire alarm system so that the system is muted when the fire alarm system is activated. The sound systems in each area will incorporate two wireless microphones, 5-disk CD player and AM/FM tuner as well as two additional inputs.

Video projection systems consisting of a projector, motorized screen, and integrated with the sound system will be provided in the auditorium and in the cafeteria. The system will incorporate DVD/VCR players, computers, incoming TV signals, and video production equipment; and remote control (Play, Stop, Pause, Rewind, Fast Forward, etc.) of central located equipment. Interactive whiteboards with ultra-short throw projectors and speakers for sound will be provided in each classroom. A digital signage system will be provided at the main lobby and cafeteria. The system will be server based with multiple channels and capable of displaying different media content on a number of LCD HDTVs (one in the lobby and four in the cafeteria).

VIDEO DISTRIBUTION SYSTEM

The video distribution system will be capable of broadcasting live or on-demand lectures directly to PC and Mac desktops at top video quality across the school over the IP network. The system will convert the local area network (LAN) into a digital video delivery network and extend video delivery to the internet. The system will support the latest video formats in the market: MPEG-2, MPEG-4, H.264 and Adobe® Flash®.

The video distribution systems can be used to custom-tailor courses for individual student groups, to deliver interactive material to off-site students, to inform students and staff of new initiatives, to monitor classrooms, to provide entertaining content to the recreational areas (gymnasium, cafeteria, etc.) and to promote access to video archives for revisiting taped video content. The system can be used to connect with alumni, parents or the greater community, by making graduation ceremonies, guest lectures, sporting events, or the school plays available on the Internet.

The distribution of Audio-Video Signals will be accomplished using network wiring to classroom interactive whiteboards. Each classroom interactive whiteboard will be wired for power, audio, video, HDMI, VDA, data and USB cables for interface with teacher/student laptop computers.

ACCESS CONTROL, INTRUSION DETECTION & VIDEO SURVEILLANCE SYSTEM

An access control system will be provided. At a minimum access control will be provided at each entry/egress door. The system will be server based and comprise of proximity card readers, badges, enrolment center and door hardware interface. An intrusion detection system will be provided. At a minimum the system will monitor all entry/egress doors and glass break detectors will be provided on the first floor of the building. A video surveillance system will be provided. At a minimum the system will monitor the building perimeter and each entry/egress door. The access control system will be integrated with the video surveillance system.

VOICE COMMUNICATIONS EQUIPMENT

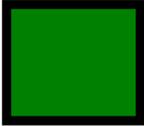

A new voice communications system will be provided. The system will comprise of a voice-over-IP (VoIP) telephone switching system, voicemail, distribution infrastructure, and telephone handsets. Telephone handsets shall be provided in each classroom, in each administration office, gymnasium, cafeteria and in each telecommunications room.

DATA COMMUNICATIONS EQUIPMENT

A new data communications system will be provided. The system will comprise of a server and storage farm, 10/100/1000 Power-over-Ethernet (PoE) switches, and wireless access points with a/b/g/n radios and controller. The servers and storage will provide a platform on which to run applications, like the school's enrollment and financial databases as well as student and teacher applications. The switches will provide connection of a number of devices together (PCs, servers, printers, etc.) over a wired data system and control access to various parts of the network. The wireless access points will provide connection of a number of devices together (PCs, servers, printers, etc.) over a wireless data system and control access to various parts of the network. The system will be setup with separate VLANs, authentication and security for administration, students and guests.

END OF TABLE OF CONTENTS

Sherwood Middle School

Sherwood Avenue, Shrewsbury, MA 01545

SCHEMATIC DESIGN

1.15 PREFERRED SCHEMATIC DESIGN

L. Outline Specifications

- Proprietary Specifications

See attached Building Committee Meeting Minutes authorizing four items as proprietary specification items for the Sherwood Middle School project. The primary reason for the proprietary specifications is that these items are part of a district wide system and maintenance programs, communications, and access are based on a particular manufacturer.

Throughout the schematic design package, particular manufacturer products are cited in the specifications and drawings to assist the cost estimating process with as much detail as possible. Other than those authorized by the Building Committee, no items are intended to be proprietary in nature, and in future design phases non-proprietary items will be specified as required by public bid laws.

MINUTES
SHERWOOD MIDDLE SCHOOL BUILDING COMMITTEE
November 10, 2009

Present: Mr. Fitzgerald, Mr. Carney, Dr. Sawyer, Mr. Lebeaux, Ms. Canzano, Mr. Hale (for Mr. Morgado), Ms. Nash

Also: Mr. Pagano, Mr. Queeney, Ms. Jones, Ms. Lizotte

Call to order at 7:04 PM.

On a motion by Mr. Lebeaux, second by Ms. Canzano, the minutes of October 27, 2009 were accepted.

On a motion by Ms. Nash, second by Mr. Lebeaux, the following bill schedules were approved

Company	Amount
PMA (#4)	\$10,667.00
LPA	\$63,258.50

- Mr. Queeney presented technical notes dated November 10, 2009, that were reviewed and discussed. He reported that the CM at risk application is near completion. He reported that the request for additional gym space is under review at MSBA and that he is working with the staff in justifying the request. He reported that the Special Education report to the Department of Elementary and Secondary Education has been completed by Shrewsbury staff and LPA. He confirmed that the MSBA will hold their final vote on January 27, 2010.
- Mr. Pagano presented the architect's report. He stated that the MSBA has informed LPA that all submittals must be completed by December 17th. Mr. Pagano stated that his firm is working to get all necessary filings complete by December 11th. Mr. Pagano stated that the LPA received proposals from Yankee Engineering and McPhail Associates for the second phase of geo-technical work. The work entails borings for the perimeter of the proposed building footprint. Mr. Pagano recommended Yankee Engineering at \$7,780, significantly less than the \$19,000 proposed by McPhail. On a motion by Dr. Sawyer, seconded by Ms. Canzano, the Committee voted unanimously in favor of hiring Yankee. Mr. Pagano reported that his kitchen consultant has met with Shrewsbury staff and has confirmed that the size of the kitchen is adequate. He stated that the dishwashing operation has changed from a separate room to a smaller area that will be used to wash pots and pans. Mr. Pagano presented a revised site plan that illustrates the proposed bus lanes, expanded parking area between Oak and Sherwood, and a fire lane around the perimeter of the building that was requested by the Fire Chief. He also stated that the mechanical room has been relocated to allow for ground level access. Mr. Pagano stated that he will be proposing some earthen mounds to buffer the new building from the homes located on Sherwood Road.
- Mr. Pagano asked the Committee how his firm might be able to help in preparing for the public hearing on the proposed project. Mr. Fitzgerald stated that the traffic proposal involving the new access point on Crescent Street must be clearly articulated. He suggested a clear map illustrating routes and counts during the morning and afternoon periods. He stated that this should be juxtaposed against the current traffic pattern.

- Mr. Pagano stated that a vote of the School Committee on the project prior to the final submittal of documents would be helpful.
- On a motion by Ms. Nash, seconded by Ms. Canzano, the Committee voted in favor of designating the following items as proprietary for the specifications pursuant to G.L. c.30, s39M(b). The reason for such designation is the purposes of standardization with several other buildings within the Town's building inventory.

Boilers	Cleaver-Brooks Inc.
HVAC Controls	Johnson Controls Inc
Door Hardware	Sargent Manufacturing Company
Telephone System	NEC/Blackbox

- The Committee reviewed the schedule of upcoming meetings. The next meeting will be an update before the School Committee on November 18th. The next regularly scheduled Committee meeting will be held on Monday, November 23rd at 730PM rather than the 24th as previously shown on the calendar. Mr. Fitzgerald asked Mr. Hale to assist in publicizing the hearing. The Committee will provide an update to the Board of Selectmen on Monday, November 30th and will have its final regularly scheduled meeting in calendar year 2009 on Tuesday, December 8th.
- Mr. Carney requested an update on the Board of Selectmen's review of the use of Crescent Street. Mr. Lebeaux reported that the Board voted in favor of the proposal.

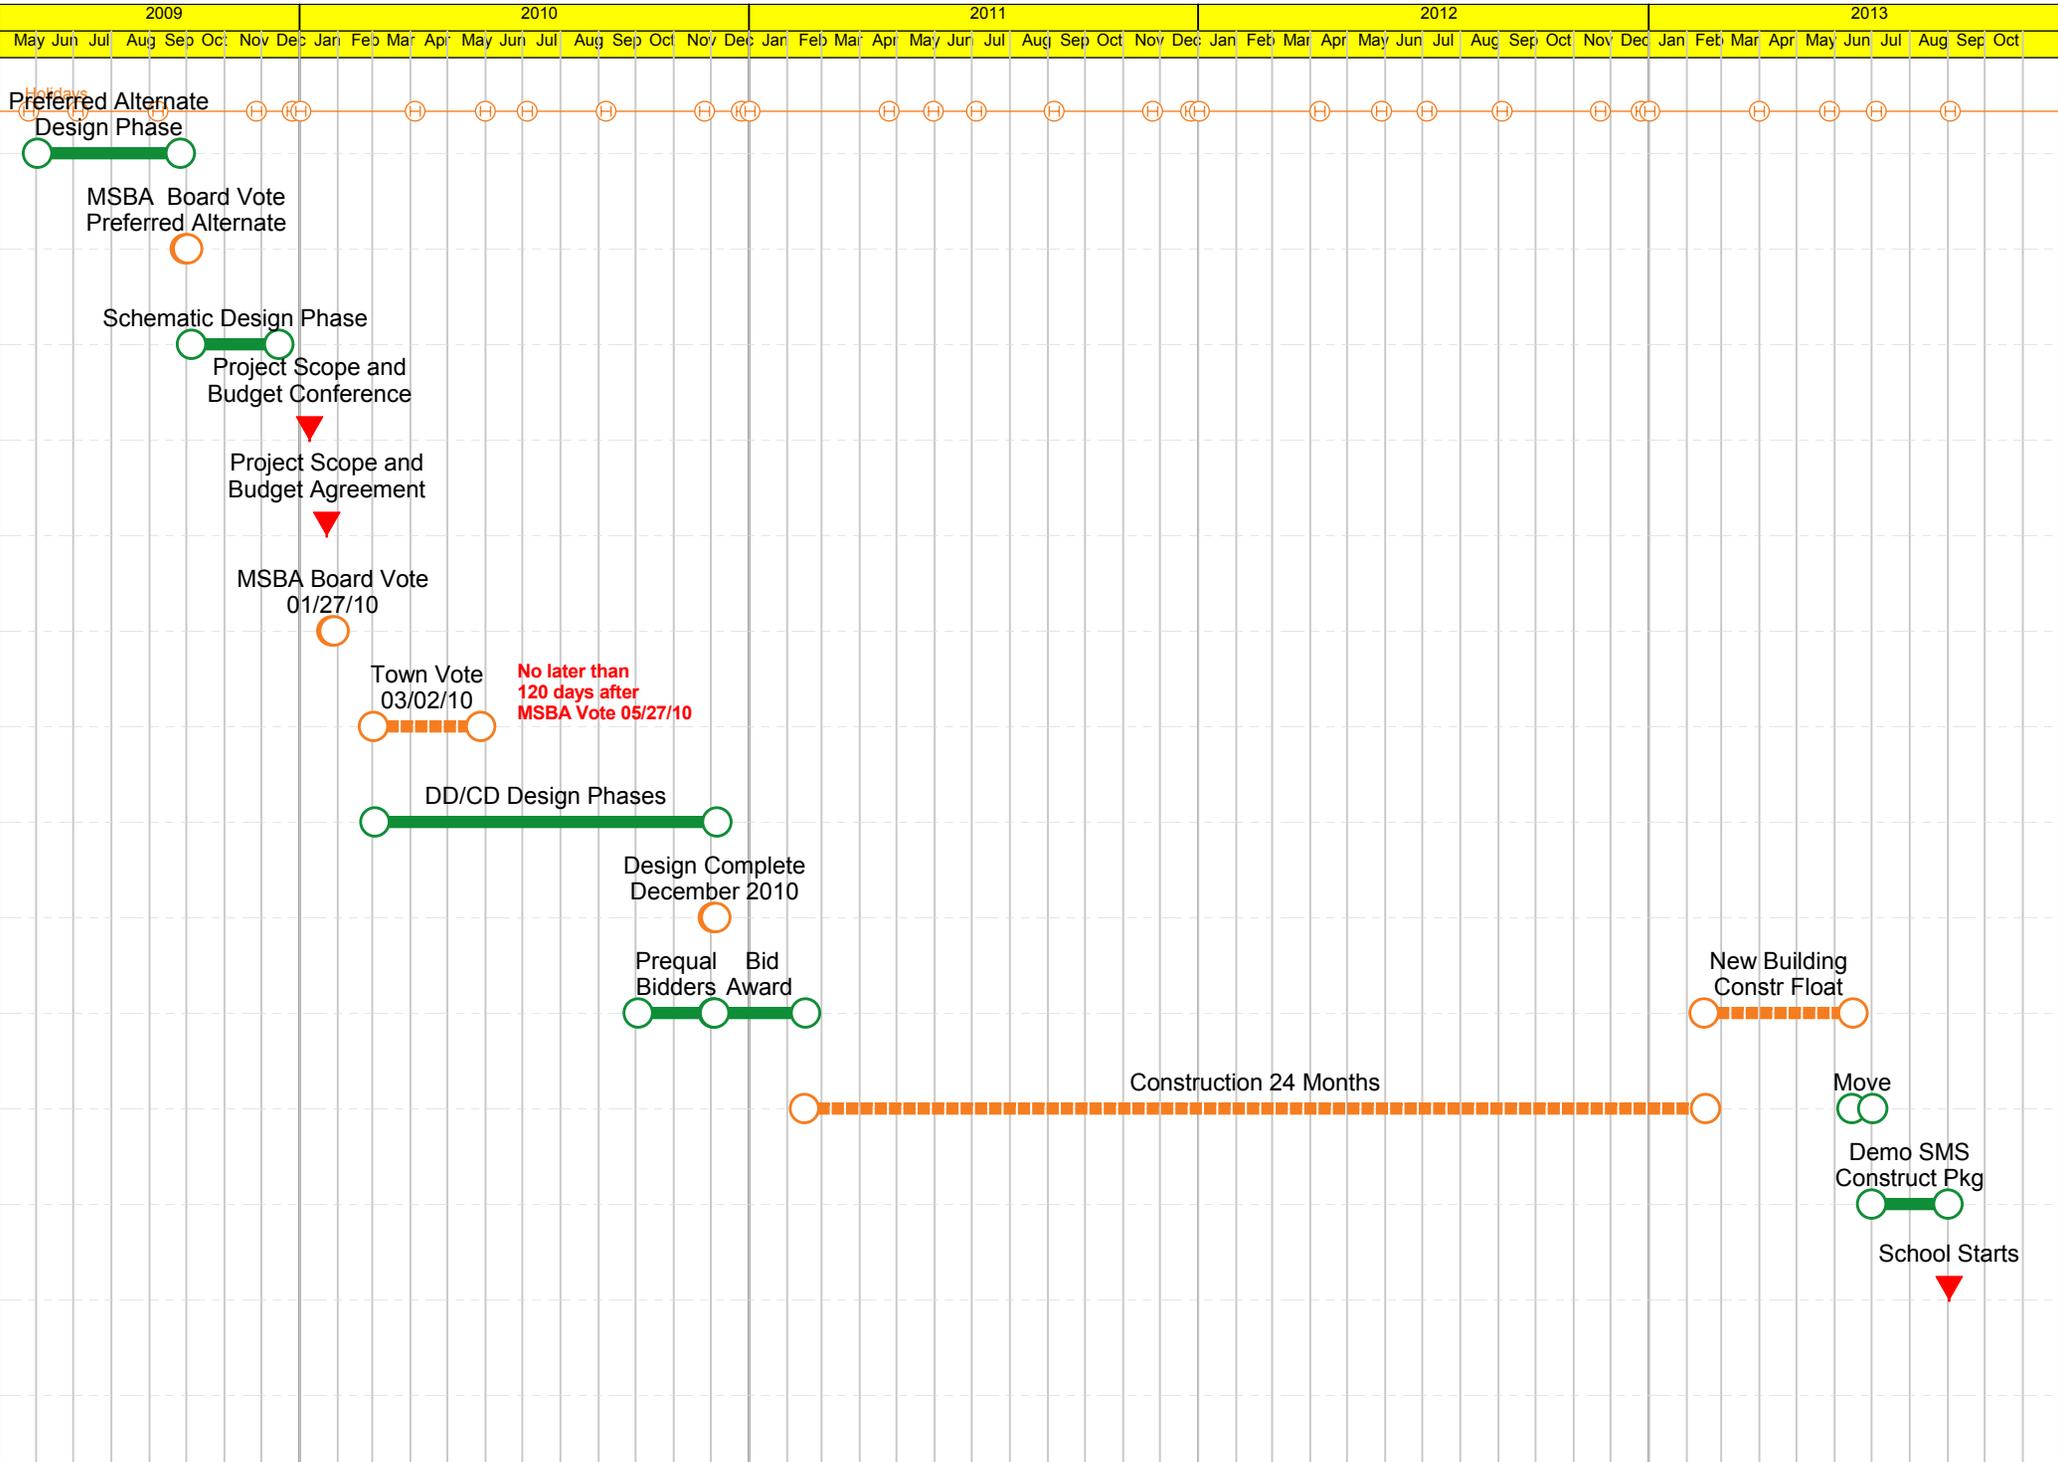

The meeting adjourned at 7:52 PM.

Respectfully submitted,

Michael R. Hale
Assistant Town Manager

MAIN CONSTRUCTION COST SUMMARY

	Construction Start	Gross Floor Area	\$/sf	Estimated Construction Cost
NEW MIDDLE SCHOOL	Apr-11	129,060	\$181.59	\$23,435,672
HAZARDOUS MATERIAL ABATEMENT				\$575,000
DEMOLITION OF EXISTING SCHOOL				\$450,000
SITework				\$2,763,056
SUB-TOTAL		129,060	\$210.94	\$27,223,728
GENERAL CONDITIONS				\$1,812,299
BONDS	0.65%			\$176,954
INSURANCE	1.25%			\$340,297
PERMIT	1.00%			\$272,237
OVERHEAD AND FEE	4%			\$1,088,949
ESCALATION TO MID-POINT (2nd QTR 2012) -3% per year	7%			\$1,905,661
DESIGN AND PRICING CONTINGENCY	10%			\$3,282,013
TOTAL OF ALL CONSTRUCTION		129,060	\$279.73	\$36,102,138

This Schematic Design Construction cost estimate was produced from drawings, outline specifications and other documentation prepared by Lamoureux Pagano and their design team dated November 17, 2009. Design and engineering changes occurring subsequent to the issue of these documents have not been incorporated in this estimate.

This estimate includes all direct construction costs, general contractor's overhead and profit and design contingency. Cost escalation assumes start dates indicated.

Bidding conditions are expected to be public bidding under Chapter 149 of the Massachusetts General Laws to pre-qualified general contractors, and pre-qualified sub-contractors, open specifications for materials and manufactures.

The estimate is based on prevailing wage rates for construction in this market and represents a reasonable opinion of cost. It is not a prediction of the successful bid from a contractor as bids will vary due to fluctuating market conditions, errors and omissions, proprietary specifications, lack or surplus of bidders, perception of risk, etc. Consequently the estimate is expected to fall within the range of bids from a number of competitive contractors or subcontractors, however we do not warrant that bids or negotiated prices will not vary from the final construction cost estimate.

ITEMS NOT CONSIDERED IN THIS ESTIMATE

Items not included in this estimate are:

- All professional fees and insurance
- Building Permit costs
- Land acquisition, feasibility, and financing costs
- All Furnishings, Fixtures and Equipment
- Items identified in the design as Not In Contract (NIC)
- Items identified in the design as by others
- Owner supplied and/or installed items (e.g. draperies, furniture and equipment)
- Rock excavation; special foundations (unless indicated by design engineers)
- Utility company back charges, including work required off-site
- Work to City streets and sidewalks, (except as noted in this estimate)
- Construction or occupancy phasing or off hours' work, (except as noted in this estimate)

*NOTE: This document was prepared by the MSBA based on a preliminary review of information and estimates provided by the Town of Shrewsbury for the Sherwood Middle School project. Based on this preliminary review, certain budget, cost and scope items have been determined to be ineligible for reimbursement, however, this document does not contain a final, exhaustive list of all budget, cost and scope items which may be ineligible for reimbursement by the MSBA. Nor is it intended to be a final determination of which budget, cost and scope items may be eligible for reimbursement by the MSBA. All project budget, cost and scope items shall be subject to review and audit by the Authority, and the Authority shall determine, in its sole discretion whether any such budget, cost and scope items are eligible for reimbursement. The MSBA may determine that certain additional budget, cost and scope items are ineligible for reimbursement.

1.15 PREFERRED SCHEMATIC DESIGN

- O. OPM Review of SD Documents

Town of Shrewsbury, Sherwood Middle School
O.P.M. Commentary on Schematic Design Drawing Review
Prepared by PMA Consultants, LLC

Background

As part of its services as Owner's Project Manager for the Town of Shrewsbury's Sherwood Middle School project, PMA Consultants LLC (PMA) has reviewed the schematic design drawings that have been prepared by the architect, Lamoureux Pagano Associates (LPA). These drawings and other schematic design documentation are being submitted to the Massachusetts School Building Authority (MSBA) for the purpose of advancing the project to a Project Scope and Budget Agreement and an MSBA Board Vote to approve the agreement. The delivery of the documents to the MSBA is planned for December 11, 2009 and the MSBA Board vote is scheduled to occur on January 27, 2010.

The submittal of the schematic design documents to the MSBA marks the completion of 6 month effort that included: review of the educational program needs, an evaluation of the existing Sherwood Middle School and site, identification of deficiencies, the development of various options (no-build, add/reno, & new-build), the selection and approval of a preferred option, and the design of the preferred option. PMA has served as the Town of Shrewsbury's OPM throughout these 6 months and has monitored and reviewed the progress of the design and made periodic reports to the Sherwood Middle School Building Committee and the MSBA. Through out this process all of the MSBA's formal requirements were met, all informal MSBA guidance was followed, and all of the necessary interim MSBA approvals were received and documented through MSBA Board votes and MSBA letters.

MSBA Requirements for Schematic Design Drawings

The schematic design requirements are documented in 963 CMR 2.00 and the MSBA's Feasibility Study Requirements for MSBA Funded Projects. These requirements indicate that the schematic design shall include site plans and building plans of all floors and roofs. The drawings must depict all elements of the building with overall dimensions and indications of the gross square footage of each floor and the net square footage of each space. The plans must also include exterior elevation views of each exterior side of the building and indicate the exterior finishes. Also required by the MSBA are schematic plans of the plumbing, HVAC, fire protection, and electrical systems – these plans are required to show the basic distribution concepts of the systems and indicate the major pieces of equipment for each system.

Content of the Schematic Design Drawings

All of the schematic design drawings prepared by LPA either met or exceeded the MSBA requirements for schematic design. Many drawings went beyond showing “the basic distribution concepts of the systems” to such an extent that they were very close to, or met, the requirements for the subsequent design development (DD) phase for a building project of this type. Particularly worthy of note for their high quality were the site drawings, architectural floor plans, electrical drawings, and HVAC drawings. The schematic design estimators for this project (A. M. Fogarty and PM&C) had high praise for the quality and detail of the drawings and indicated that this level of quality and detail allowed for the use of more precise cost estimating techniques that provided a higher level of confidence in the total project cost than is normally achieved in a schematic design estimate.

Comments on the Schematic Design

In addition to the drawing requirements discussed above, the MSBA’s schematic design requirements dictate that the architect consider site conditions (including topography, existing utilities, and subsurface soil conditions), the building code, ADA and special education requirements, environmental regulations, energy efficiency, sustainable design, traffic, and coordination with the surrounding neighborhood – all while meeting the educational objectives and operational requirements of the School District and the mandate of the Building Committee to provide an efficient, practical design at a reasonable cost. Thus far, the schematic design of the Sherwood Middle School has met or exceeded all of these requirements. Interim acceptance and/or approvals have been received from the MSBA, the Building Committee, the School Committee, and the Board of Selectman. Design attributes that have been receiving particular appreciation include: the proximity of the building to the nearby Oak Middle School, new site access and traffic patterns, the compactness and energy efficiency of the building, and the configuration of administrative and common spaces with adjoining class room wings that are configured to support the cluster and team teaching approach employed by the District.

		E	Minor Concern

ITEM NO.	DWG REF	ISSUE NUMBER	COMMENT	COMMENT CODE	REVIEW DATE	REVIEW BY
1	C0.01	1	Above North arrow on left side of dwg, location of match sheet C0.02/C0.01 should be adjusted.	D	4-Dec-09	PHQ
2	L-2	1	Provide dimensions of new backstop and chain link fences at new baseball field and indicate reference to dwg L-4 for details.	D	4-Dec-09	PHQ
3	L-2, L-3	1	Indicate removal of existing fence and backstop at existing baseball field and relocation of existing bleachers. Extend limit of work line to include fence, backstop, and bleachers	D	4-Dec-09	PHQ
4	L-4	1	Extend limit of work to indicate removal of existing BCW at Crescent St end of new access road .	D	4-Dec-09	PHQ
5	L-4	1	Details 1 thru 5 should indicate L-2 rather than L-3.	D	4-Dec-09	PHQ
6	L-2	1	Add basketball hoop to legend or label the symbol on the courts.	D	4-Dec-09	PHQ
7	L-2	1	Provide details for planter	C	4-Dec-09	PHQ
8	L-2	1	Put flag pole on plan, it is shown on detail sheet L-4.	D	4-Dec-09	PHQ
9	L-4	1	Show add'l grade lines on access road between the current 584 foot elevation line and the existing grade at intersection with Crescent St.	D	4-Dec-09	PHQ
10	C200	1	General note 1, suggest adding text to indicate that the existing conditions drawings are included with the contract dwgs C0.01 thru C0.04.	D	4-Dec-09	PHQ
11	C200	1	On note 20, fill in date and DEP # for order of conditions by Shrewsbury Conservation Commission.	D	4-Dec-09	PHQ
12	C200	1	Eliminate stray arrow on detail for bituminous concrete Cape Cod berm.	D	4-Dec-09	PHQ
13	C203	1	Underground detention plan indicates "access manhole (see detail)" yet detail is not provided (there are 4 black circles, 2 on each end, that designate these manholes.	C	4-Dec-09	PHQ
14	C100	1	Where underground detention system is shown on plan, add note to refer reader to C203 for details.	D	4-Dec-09	PHQ
15	C203	1	Suggest additional details be provided for the underground detention plan, such as the length of the piping, length of the excavation, and details of how the 4 access manholes fit in the excavation and connect to the pipes.	C	4-Dec-09	PHQ

ITEM NO.	DWG REF	ISSUE NUMBER	COMMENT	COMMENT CODE	REVIEW DATE	REVIEW BY
16	S1.0-S1.3	4	Although adequate for schematic design, additional info is required as design progresses; including bracing details with elev views, loading of bracing so that connections can be designed, and the weights of members.	D	4-Dec-09	PHQ
17	S1.0-S1.3	4	Section-1 requires indication of rebar sizes and spacings.	D	4-Dec-09	PHQ
18	FP-2 thru FP-4	5	Subsequent dwgs should show layout of sprinkler heads.	D	4-Dec-09	PHQ
19	A-6, A-7	2	Suggest providing the reflected ceiling plan legend on dwgs A-6 and A-7; it is shown on first refl ceiling plan A-5, repeating it on A-6 and A-7 will elim the need to refer back to A-5	D	4-Dec-09	PHQ
20	A-5, A-6, A-7	2	Will future reflected ceiling plans indicate sprinkler heads, lighting fixtures, and supply/return diffusers/registers?	D	4-Dec-09	PHQ
21	A-7	2	At upper lobby and art room, should details be provided for unistrut grid? If it is industry practice to leave this to be designed and submitted by the contractor, then perhaps a reference to the spec should be put on the plan.	D	4-Dec-09	PHQ
22	A-8	2	Section cuts should be provided for solar wall panel.	D	4-Dec-09	PHQ
23	A-8, A-10	2	Where reference is made to particular manufacturer's and products, the phrase "or equal" should be included.	D	4-Dec-09	PHQ
24	S1.0	4	Although adequate for schematic design, additional info is required as design progresses; including bracing details, connection details, and weights of members.	D	4-Dec-09	PHQ
25	E-3, E-4, E-5	8	At classroom wings there is a note that says "refer to dwg E5 for typical classroom lighting requirements" this should refer to E-6 instead of E-5.	D	4-Dec-09	PHQ
26	E-7, E-8, E-9	8	At classroom wings there is a note that says "refer to dwg E-9 for typical classroom fire alarm, power and low voltage requirements" this should refer to E-10 instead of E-9	D	4-Dec-09	PHQ
27	A-4, A-7	2	For art rooms, are the roof details above the art room (A-4) compatible with the reflected ceiling plan on A-7?	B	4-Dec-09	PHQ
28	A-4, A-7	2	For sloping roof above art rooms, elev 625'-4" is provided at high end of the slope; an elevation at the low end of the slope should also be provided, or an indication of what the slope is.	C	4-Dec-09	PHQ
29	A-1	2	Should the architectural dwgs have a general notes page with abbreviations?	D	4-Dec-09	PHQ
30	A-4	2	Gymnasium roof doesn't show access from the catwalk that is indicated on drawing A-3 of the mechanical room that is beneath the gym roof. Also, it might be worth considering if the lobby stairwell should include access to the admin/media/classroom wing roof (622'-8"), so that the RTUs on this roof can be serviced.	C	4-Dec-09	PHQ
31	A-9	2	Although it is obvious where the building sections on dwg A-9 are taken, it would be good to number the sections on A-9 and show on the plan view dwgs A-1, A-2, & A-3 where these sections are taken.	D	4-Dec-09	PHQ
32	A-10	2	The locations where these wall sections are taken should be shown on the plan view dwgs.	D	4-Dec-09	PHQ
33	HVAC/Plumbing	7	Although adequate for schematic design, as the design progresses, future dwgs should show the fin tube radiator lines (currently not indicated on plumbing or HVAC dwgs).	D	4-Dec-09	PHQ
